APPENDIX A

#### WAUSHARA COUNTY GROUP D QUESTIONNAIRE RESULTS SUMMARY City of Wautoma, Village of Redgranite, Town of Dakota, Town of Marion and Town of Wautoma

The following report is a summary of the group D questionnaire results. A complete copy of the report is available for review at the respective community city, village and town halls, Wautoma and Redgranite Public Libraries and the Waushara County Zoning Office.

A questionnaire was conducted for the City of Wautoma, Village of Redgranite and the towns of Dakota, Marion and Wautoma Comprehensive Planning Committees to gather opinions from residents and landowners regarding land use and development issues. A representative sample of questionnaires was sent out to the Town of Marion. Within the remaining municipalities, questionnaires were sent out to all landowners. Additional questionnaires were available at the respective municipalities for renters and other residents or landowners who did not receive a questionnaire by mail. The questionnaire was translated into Spanish and was available through the UW-Extension office and St. Joseph's Church in Wautoma. Each household was asked to complete one questionnaire. Three thousand five hundred and fifty seven questionnaires were distributed among the five municipalities and 1,230 were returned, resulting in an overall response rate of 35 percent.

	No. of Que	stionnaires	Response
Municipality	Sent	Returned	Rate
C. Wautoma	702	235	33%
V. Redgranite	413	151	37%
T. Dakota	735	248	34%
T. Marion	947	342	36%
T. Wautoma	760	254	33%
Total	3,557	1,230	35%

# Waushara County Group D

The questionnaire contained 16 questions for the City of Wautoma and Village of Redgranite and 17 questions for the towns of Dakota, Marion and Wautoma. There was one open ended question and two additional questions where written input was solicited. Some respondents did not answer all the questions.

#### SUMMARY OF FINDINGS

#### **General Information**

- 70 percent of the respondents indicated that they were full-time (permanent) residents of their respective municipalities.
- 41 percent of the respondents indicated that they were retired, corresponding to the 36 percent of the respondents who noted that they were 65 years old or older.

- 66 percent of the respondents signified that they had lived in their municipality for 11 or more years and 64 percent own less than 5 acres.
- The majority of the respondents indicated that they live on a typical city or village lot (23.4%), lakeshore/lake view or waterfront lot (22.1%) or rural property of under (18.9%) or equal to 5 acres or more (17.7%).

# Rate Your Municipality

- The majority of the respondents rated the quality of the environment (82.4%), recreational opportunities (67.2%), and parks/public recreation lands (76.6%) as good or very good.
- Respondents also felt that municipalities were doing a good or very good job of providing fire protection (76.8%), law enforcement (73.9%), school facilities (66.2%), library (62.6%) and emergency medical services (71.4%).
- 65 percent of the respondents rated economic opportunities as poor to fair.
- People indicated that small town living/rural atmosphere, quiet/peaceful, scenery/environment, low crime rate and the friendliness of the area were the top aspects of their municipalities that they value most.
- The top issues that people felt were facing their municipalities included: lack of job opportunities; new businesses and activities for youth; increase in taxes and land prices; low wages; and vacant buildings and storefronts.

# Existing Development

- Generally the majority of people indicated that there was about the right amount of all types of housing in their respective municipalities and the overall area.
- A third of the respondents in the Village of Redgranite felt that there was not enough low to moderate income development, while a third in the City of Wautoma felt that there was too much.
- A quarter of all respondents and a third in the City of Wautoma said that more condominiums were needed.
- A third of the respondents saw a need for more assisted living for the elderly; this percentage was higher in the towns than in the two incorporated municipalities.
- Over forty percent of the respondents felt that there were too many mobile home parks in the municipalities and within the overall area.

#### **Future Development**

- Approximately 80 percent of the respondents from all municipalities support small scale retail (79.7%) and industrial development (80.3%).
- Over 80 percent of the respondents indicated that they would support or accept service (65.4%/18.2%), tourism (63.0%/19.5%), and small scale agricultural (65.8%/17.5%) development.
- Large scale agricultural development garnered the lowest support of all types of development surveyed.

# Planning for the Future

- Protection of groundwater, wetlands, lakes, rivers and streams was the number one overall issue and the most important issue in the towns of Dakota, Marion and Wautoma.
- Protection of private property rights was the second most important overall issue.
- Improving the quality of life for our children and grandchildren was the third most important issue overall and second most important in the City of Wautoma and Village of Redgranite.
- Attraction of good paying jobs was the most important issue in the City of Wautoma and Village of Redgranite.
- Protection of woodlands was the second most important issue in the Town of Dakota and the third most important issue in the towns of Marion and Wautoma.
- Providing cost effective community facilities was the fourth most important issue in the Village of Redgranite.

# CHARACTERISTICS OF RESPONDENTS

Overall, about 70 percent of the respondents indicated that they were permanent year round residents within their respective communities and this category captured the highest percentage of respondents in all five municipalities. About 21 percent of the respondents were seasonal residents, the highest percentage being in the Town of Marion (40.6%). Forty-one percent, or a significant number of people indicated that they were retired. This corresponds to the 36 percent of respondents who noted that they were 65 years old or older. Overall, 66 percent of the people said that they had lived here for 11 or more years, (this figure includes part-time residents) and 64 percent own less than 5 acres. The majority of people live on a typical city or village lot (23.4%), lakeshore/lake view or waterfront lot (22.1%), rural property of less than 5 acres (18.9%), or rural property of 5 or more acres (17.7%).

#### RATE YOUR COMMUNITY

Respondents were asked to rate their municipality on the quality of the environment; economic, educational and recreational opportunities; access to goods and services; the quality of public facilities and services; on the aspects that they value most; and the top issues facing their municipalities.

The majority of respondents rated the quality of the environment (82.4%), recreational opportunities (67.2%), parks/public recreation lands (76.6%), fire protection (76.8%), law enforcement (73.9%), school facilities (66.2%), library (62.6%), and emergency medical (71.4%) as good to very good. Slightly lower approval ratings (fair to good) were given to opportunities educational (63.5%), access to goods and services (71.5%),maintenance/condition of roads/streets (73.7%), snow removal (66.9%), adult educational opportunities (56.2%), and availability of hospitals and medical services. On the other hand, economic opportunities were rated poor to fair by 65 percent of the respondents.

The top five aspects that respondents valued most included: small town living/rural atmosphere (22.4%); quiet/peaceful (20.2%); the scenery/environment (15.4%); low crime rate (9.0%); and the friendliness of the area (9.4%).

While respondents were in basic agreement regarding the top issues facing their municipalities, respondents in the City of Wautoma, Village of Redgranite and the Town of Wautoma felt that the top issue was the lack of job opportunities, while respondents in the Town of Dakota and the Town of Marion rated increase in taxes as the number one issue. Other issues that ranked within the top five included lack of new businesses (second overall), increase in land prices (fifth overall), and low wages (fourth overall). While not ranking as top five issues collectively, lack of activities for youth and vacant buildings/storefronts were among the top five issues within the respective municipalities.

# EXISTING DEVELOPMENT

Respondents were asked if they felt if there was too much, about right, or not enough of the following housing types: single family; low to moderate income; duplexes; multi-unit apartments; condominiums; assisted living – elderly; mobile home parks; and high income development. Generally, the majority of people indicated that there was about the right amount of all types of housing in their respective municipalities and the overall area. However, even though respondents indicated that they overwhelmingly thought that there was enough single family and duplex development, the response to the remaining housing types was more mixed.

A third of the respondents in the Village of Redgranite felt that there was not enough low to moderate income development, while a third in the City of Wautoma felt that there was too much. Twenty-one percent of the respondents in the village thought that more apartments were needed. A quarter of all respondents and a third in the City of Wautoma said that more condominiums were needed. A third of the respondents saw a need for more assisted living for the elderly, this percentage was higher in the towns than in the two incorporated municipalities.

Over forty percent felt that there were too many mobile home parks in the municipalities and within the overall area. A quarter of the respondents indicated that the amount of high income housing was too much and an equal number said there wasn't enough.

Between 20 to 30 percent of the respondents failed to answer the questions in this category. A lower response rate, however, is not calculated into the overall total responses for the questions in this section.

# FUTURE DEVELOPMENT

Respondents were asked if they felt that there was a need for new development in the area and, if there was, what type of new development they believe would be best. People were asked if they supported; do not support, but accept; do not support; or have no opinion on the following types of development: Large, moderate and small scale industrial development; service and tourism development; small, and moderate to large agricultural development; and small and large retail development.

Respondents from all municipalities overwhelmingly threw their support behind small scale retail (79.7%) and industrial development (80.3%). However, even though people were willing to support or accept larger industrial and retail development, as the scale of the proposed development increased, the support and acceptance decreased. Over 80 percent of the respondents indicated that they would support or accept service (65.4%/18.2%), tourism (63.0%/19.5%), and small scale agricultural (65.8%/17.5%) development. Large scale agricultural development garnered the lowest support among the types of development surveyed. A third of the respondents indicated that they would accept this and a quarter indicated that they could neither support nor accept large scale agricultural development.

# PLANNING FOR THE FUTURE

Respondents were asked to indicate the importance of various decisions that should be considered when planning for the future. These issues involved: the promotion of development that minimizes costs and the redevelopment lands with existing infrastructure; encouragement of coordination and cooperation between municipalities and neighborhood designs that support a range of transportation choices; the protection of groundwater, wetlands, lakes, rivers, streams, agricultural lands, woodlands and private property rights; preservation of cultural, historic and archaeological sites; provision of an adequate supply of affordable housing for all income levels; attraction of good paying jobs; community participation in land use planning and decision making; attractiveness of the community; and improving the quality of life for our children and grandchildren.

While people indicated that all issues were important, some issues emerged as more important than others. Differences were also seen among the municipalities. The top issues were the protection of groundwater, wetlands, lakes, rivers and streams (1<sup>st</sup> overall and in the towns of Dakota, Marion and Wautoma); protection of private property rights (2<sup>nd</sup> overall and in the towns of Dakota, Marion and Wautoma); improving the quality of life for our children and

grandchildren (3<sup>rd</sup> overall and 2<sup>nd</sup> in the City of Wautoma and Village of Redgranite); attraction of good paying jobs (4<sup>th</sup> overall and 1<sup>st</sup> in the City of Wautoma and Village of Redgranite); protection of woodlands (5<sup>th</sup> overall and 2<sup>nd</sup> in the Town of Dakota, 3<sup>rd</sup> in the towns of Marion and Wautoma); and providing cost effective community facilities (9<sup>th</sup> overall and 4<sup>th</sup> in the Village of Redgranite).

APPENDIX E

# APPENDIX E Rare, Threatened, and Endangered Species and Natural Communities

Table E-1	E-1
Table E-2	E-2
Table E-3	E-2
Table E-4	E-2
Table E-5	E-2

The Wisconsin Department of Natural Resources Natural Heritage Inventory (NHI) is an on-line database which provides statewide inventory of KNOWN locations and conditions of rare and endangered species. All areas of the state have not yet been inventoried. Thus, the absence of a species within this database does not indicate that particular species or communities are not present within the listed towns. Nor does the presence of one element imply that other elements were surveyed for but not found. Despite these limitations, the NHI is the state's most comprehensive database on biodiversity and is widely used. Species are listed by their type, scientific name, and common name; the last observed record is indicated.

Community or			Observation
Species Type	Scientific Name	Common Name	Date
Bird	Perisoreus canadensis	Gray jay	1996
Invertebrate	Ophiogomphus carolus	Riffle snaketail	1996

Community	Norther Wet Forest	Norther Wet Forest	1978
Fish	Fundulus diaphanus	Banded killfish	1979
Fish	Lythrurus umbratilis	Redfin shiner	1979
Fish	Notropis texanus	Weed shiner	1979
Plant	Arabis missouriensis var. deamii	Deam's rockcress	1958

\* In most cases, locations for species and natural communities surveyed and listed in the NHI are available down to the town level. The exception are those species whose locations are considered to be sensitive (particularly vulnerable to collection or disturbance). Locations of these species or natural communities are generalized down to the county level in order to minimize impacts to them. To best represent the rare, threatened, or endangered species which may be present in the Village of Redgranite, tables for the towns of Leon and Warren are included in this appendix.

## An Innovative Tool for Managing Rural Residential Development: A Look at Conservation Subdivisions

by Anna Haines, Ph.D.

This is the second of two articles addressing rural residential development. The <u>previous article on rural residential development</u> provided a definition of four related management tools (large minimum lot size, purchase of and transfer of development rights, and conservation subdivisions), and explained briefly how each tool worked, its potential benefits and limitations, and provided a list of references. In this article, I will provide a more in-depth look at conservation subdivisions.

The comprehensive planning law (or "Smart Growth" law) specifies nine elements that must be in the comprehensive plan. Among them is the implementation element that needs to outline the types of plan implementation tools a community will use to implement its plan. One primary goal of many communities is to balance residential development with agricultural needs, open space, and natural resources while trying to retain a sense of place. This kind of goal can make an important link between the housing, and agriculture, cultural and natural resources element of the comprehensive plan. Consideration of the goals and objectives within the comprehensive plan is necessary as the community considers the types of tools it will use to achieve its plan. One potentially useful tool to achieve the above goal is to describe conservation subdivisions as a *floating* zoning district or a conditional use in residential districts in the local zoning or land division code.

A model conservation subdivision ordinance was prepared by UW Extension. Local governments are not required to adopt this ordinance (see Ohm 2000), but may find it useful in crafting their own conservation subdivision ordinance.

#### **Conservation Subdivisions: A Definition**

Conservation subdivisions are characterized by common open space and clustered compact lots. The purpose of a conservation subdivision is to protect farmland and/or natural resources while allowing for the maximum number of residences under current community zoning and subdivision regulations. In

some cases a greater density (density bonus) may be offered in the local ordinance to encourage this approach to residential development planning. Generally, this tool is used for parcels 40 acres or larger.

#### **Development Density**

One interesting feature of conservation subdivisions is that they are density neutral (except where a density bonus is offered). What does density neutral mean? Many people assume that a conservation subdivision automatically implies a reduction in the number of lots allowed on a parcel of land. Actually, the same numbers of lots are built in a conservation subdivision as would be built in a conventional subdivision. Thus, a conservation subdivision maintains the same level of density as a conventional subdivision. Conventional lot-by-lot subdivisions spread development evenly throughout a parcel without consideration to environmental or cultural features (Ohm 2000).

The primary difference between conservation subdivisions and conventional ones involves the location of the homes on one part of the parcel, i.e., the homes are clustered. Other changes involve management and ownership of the land that has been left for preservation.

#### **Open Space Design, Use and Ownership Options**

Conservation subdivision ordinances generally require permanent dedication of 40% or more of the total development parcel as open space. Open space design requirements often include contiguity and connection to other open space or conservation areas. Open space uses may include agriculture, forestry or outdoor recreation and in some cases has included use for waste water disposal or sports facilities in urbanizing areas. There are a variety of ownership choices for the open space (individual residential lots are owned as in conventional subdivisions): The original landowner can retain ownership of the land and continue to use it as a farm, for example (usually agricultural use is limited; a confined animal feed lot is an inappropriate use, while a vegetable farm is appropriate); a homeowner's association could manage it, it can be held as individual outlots for each of the building lots, or a local government or a land trust can manage the property for conservation purposes or outdoor recreation.

#### Consolidated infrastructure and reduced development costs

Clustering homes reduces the amount of infrastructure. For example, the linear miles of road are reduced; thus, the associated costs of construction, operations and maintenance are also reduced. As well it is possible to share wells and septic systems in these clustered developments. However, placement of wells and septic systems must be carefully designed to prevent unwanted uptake of wastewater into private wells.

#### **Marketing amenities**

Conservation subdivisions are desirable from a developer/realtor perspective. They appeal to potential homeowners who want easy access to open space for the views and/or for a range of outdoor activities, i.e., a "golf course" development without the golf course.

#### How it works

One of the more popular methods is advocated by Randall Arendt who has outlined a four step process. The process begins with the community identifying the cultural and natural resources that are valued on a specific parcel earmarked for development. This communication results in (i) identifying primary and secondary conservation areas, (ii) designing open space to protect them, (iii) arranging houses outside of those protected areas, and (iv) finally laying out streets, lots and infrastructure. Often between 40% to 80% of the site is permanently set aside for open space (Arndt 1992, Minnesota Land Trust 2000, Natural Lands Trust).

#### **Potential Benefits**

Conservation development or subdivisions **potentially** can benefit a community in a variety of ways:

- Achieves a community goal of preserving open space at the same density standard as is outlined in current ordinances.
- Establishes an open space network, if done within the context of a comprehensive plan and these types of developments/subdivisions are purposefully linked together. Continuous open space (farmland, forest or other natural resources) allows for greater benefits for the environment, i.e., habitat preservation for wildlife, and for a local economy if
dependent on agriculture and/or tourism. This open space network also can extend and join recreational trails.

- None of the land is taken for public use unless the developer/owners want it to be.
- Does not require public expenditure of funds.
- Does not depend on landowner charity.
- Does not involve complicated regulations for shifting rights to other parcels.
- Does not depend upon the cooperation of two or more adjoining landowners to make it work.
- Provides a quality residential and recreational environment.

#### Limitations

While conservation subdivisions can achieve a variety of benefits, there are a number of limitations to consider:

- Conservation subdivisions are not a panacea. Used alone they cannot fully accomplish goals related to establishing and preserving open space or managing residential development.
- These subdivisions should connect to a broader network of conservation areas, if not a community will have a chopped up landscape.
- Conservations subdivisions not attached to already developed areas and not connected to services can result in poor land use practices.
- If one goal of your community is to create affordable housing, conservation subdivisions may not provide this housing option. Many conservation subdivisions are expensive, and are marketed to "high end consumers." On the other hand, there is no reason why these types of subdivisions cannot include more affordable housing.
- If a goal of the community is to promote development that is less dependent on the automobile, conservation subdivisions may not help.
- Technical assistance is important. Poorly designed conservation subdivisions may not achieve open space goals of the community.

Figure 2: Good vs. Poor Cluster Design

#### Guidelines for conservation subdivision development and design:

- Conservation design is not a panacea
- Setting goals in the community's planning framework is critical.
- It is important to have good resource information
- Think big and plan for a large open space network
- Ordinances should create incentives and reduce barriers
- Open space should be diligently designed, not just set aside
- Water quality and quantity is paramount
- The management of the protected areas is critical
- Conservation development must be profitable
  - Many of the barriers to change are not technical, but institutional

#### Is This Tool "Right" for Our Community?

Each community should decide on the types of land management tools they

want to use. Recognize that your community should choose a number of tools rather than rely on one exclusively. The reason to choose a group of tools is to bring strength where one tool is weak and to send consistent signals to the development community and property owners regarding appropriate and planned uses for particular parcels. It is reasonable, for example, to have a purchase of development rights program in place along with overlay zones and a conservation subdivision ordinance. Below is a list of criteria to consider when choosing plan implementation tools, including conservation subdivisions:

- Does your community have an accepted plan that identifies rural residential development, open space, or sprawl as an issue?
- Does the plan specify goals and objectives that address how your community will contend with rural residential development?
- Will the tool accomplish any of your community's goals and objectives?

Is the tool politically acceptable? Can the local government or some other organization administer the new tool given current personnel or is another position or committee necessary?

Are there any enforcement issues local government personnel would need to contend with?

To be effective, would the same tool need to be used by adjoining communities and/or is a cooperative effort possible?

Answering the above questions will give you a better idea which tools are appropriate to use in your community. Avoid choosing any plan implementation tool before you have done your homework. Understand how that tool works and the implications for administering and enforcing it.

# Better Designs for Development in Michigan

## PUTTING CONSERVATION INTO LOCAL LAND USE REGULATIONS

ocal communities can take control of their destinies so that conservation goals will be achieved simultaneously with development objectives, in a manner that is fair to all parties concerned. This "bird's-eye" perspective shows a new way of designing residential developments which differ dramatically from the current land consumptive approach typical of most Michigan communities. In the subdivision shown above, the developer can build the maximum number of homes permitted under the community's zoning, while at the same time permanently protecting over half of the property, adding it to an interconnected network of conservation lands. The property illustrated above has been used elsewhere in this booklet to demonstrate the principles of "conservation planning/ design." If you would prefer to see new development create more livable communities and in the process conserve irreplaceable natural resources such as prime farmlands, forest land and wildlife habitat, this approach may be right for your community.

# THE CONSERVATION PLANNING/DESIGN CONCEPT

Each time a property is developed (especially for residential purposes), an opportunity exists for adding land to a community-wide network of conservation lands. Although such opportunities are seldom taken in most communities, this situation could be reversed fairly easily by making several small but significant changes to a community's land use plan and regulations

Simply stated, Conservation Planning/Design rearranges the development on each parcel as it is

being planned so that only half (or less) of the buildable land is consumed by lots and streets. Without controversial "down zoning," the same number of lots can be developed, but in a less land consumptive manner, allowing the balance of the property to be permanently protected and added to an interconnected network of conservation lands. This "density neutral" approach provides a fair and equitable way to balance conservation and development objectives.

# FOUR KEY CONSERVATION TOOLS

Experience around the country has shown communities which are likely to be successful at conserving significant amounts of land on an on-going basis incorporate the following techniques into their community planning:

#### **1** Envisioning the Future: Performing "Community Audits"

Successful communities have a realistic understanding of their future. The audit projects past and current development trends into the future so that officials and residents may easily see the longterm results of continuing with current land use regulations. Communities use this knowledge to periodically review and adjust their goals and strategies for conservation and development.

## **2**Identifying Networks of Conservation Lands

Successful communities have a good understanding of their important natural, scenic and historic resources. They establish reasonable goals for conservation and development that reflect their special resources, existing land use patterns and anticipated growth. Their Land Use Plans document these resources, goals and policies. The plan contains language about the kinds of ordinance updating and conservation programs necessary for those goals to be realized. A key part of the Land Use plan is a Map of Potential Conservation Landshat is intended to identify the location of potential conservation lands in each development as it is being laid out.

#### **3** Conservation Zoning: A "Menu of Choices"

Successful communities have legally defensible, well-written zoning regulations that meet their "fair share" of future growth and provide for a logical balance between community goals and private landowner interests. They incorporate resource suitabilities, flexibility, and incentives to require the inclusion of permanent conservation lands into new development. The four zoning options summarized in this publication, and described in detail in the Better Designs for Developmenthanual, respect the property rights of landowners and developers without unduly impacting the remaining natural areas that make our communities such special places in which to live, work and recreate.

#### **4** Conservation Design: A Four Step Process

Successful communities recognize that both design standards and the design process play an important part in conserving a community's natural and scenic resources. Such communities adopt land use regulations which require site planning while identifying the special features of each property, and introduce a simple methodology showing how to lay out new development, so that the majority of those special features will be permanently protected in designated conservation areas or preserves. To a considerable extent, these areas can be pre-identified in the Land Use Plans' Map of Potential Conser-vation Landsso that as each area is developed it will form an integral part of a community-wide network of protected conservation lands, as noted above.

## **ENVISIONING THE FUTURE**

PERFORMING "COMMUNITY AUDITS"

The future that faces most communities in Michigan under current zoning practices is the systematic conversion of every unprotected acre of buildable land into developed uses. Most local ordinances allow, encourage and in many cases mandate standardized layouts of "wall-to-wall lots." Over a period of time this process produces a broader pattern of "wall-to-wall sprawl" (see Figure 1). The "community audit" visioning process helps local officials and residents see the ultimate result of continuing to implement current land-use policies. The process helps start discussions about how current trends can be modified so that a more desirable future is ensured.

1974

1990

Figure 1 The pattern of "wall-towall subdivisions" that evolves over time with zoning and subdivision ordinances which require developers to provide nothing more than houselots and streets.

No community actively plans to become a bland expanse of suburban-type "sprawl." However, most zoning codes program exactly this outcome. Communities can perform audits to see the future before it happens, so that they will be able to judge whether a mid-course correction is needed. A community audit entails:

#### Numerical Analysis

The first step involves a numerical analysis of growth projections, both in terms of the number of dwelling units and the number of acres that will probably be converted into houselots and streets under present codes.

#### Written Evaluation

The second step consists of a written evaluation of the land-use regulations that are currently on the books, identifying their strengths and weaknesses and offering constructive recommendations about how they can incorporate the conservation techniques described in this booklet. It should also include a realistic appraisal of the extent to which private conservation efforts are likely to succeed in protecting lands from development through various nonregulatory approaches such as purchases or donations of conservation easements or fee title interests.

#### "Build-Out" Maps

The third step entails mapping future development patterns on a map of the entire community (see Figure 2). Alternatively, the "build-out map" could focus only on selected areas in the community where development is of the greatest immediate interest, perhaps due to the presence of special features identified in the Land Use Plan or vulnerability due to development pressures.

Figure 2 A matching pair of graphics, taken from an actual "build-out map," showing existing conditions (mostly undeveloped land) contrasted with the potential development pattern of "checkerboard suburbia" created through conventional zoning and subdivision regulations.

The following parts of this booklet describe practical ways in which communities can take control of their destinies so that conservation goals will be achieved simultaneously with development objectives, in a manner that is fair to all parties concerned.

## **IDENTIFYING NETWORKS OF CONSERVATION LANDS**

Ithough many communities in Michigan have adopted Land Use Plans which outline the need to protect their natural, aesthetic and historic resources, very few have taken the next logical step of identifying these areas and creating a Map of Potential Conservation Lands

Such a map is the first step for any community interested in conserving natural and aesthetic resources in an interconnected network. The Map of Potential Conservation Landsserves as the tool which guides decisions regarding which land to protect in order for the network to eventually take form and have substance.

A Map of Potential Conservation Landsually starts with information contained in the community's existing planning documents. The next task is to identify two kinds of resource areas. Primary Conservation As comprise only the most severely constrained lands, where development is typically restricted under current codes and laws (such as wetlands, flood plains, and areas where slopes exceeding 20-25% predominate). Secondary Conservation Areas include all other locally noteworthy or significant features of the natural or cultural landscape. This may include features such as mature woodlands, wildlife habi-

Figure 3 Part of a Map of Potential Conservation Lands showing roads, parcel lines, historic structures (large dots), and the following resource areas: wet-lands/floodplains (dark gray), woodlands (medium gray), open fields and pastures (white), and prime farming soils (diagonal hatched lines).

tats and scenic roadways, prime and unique farmlands, prime timberlands, groundwater recharge areas, greenways and trails, river and stream corridors, historic sites and buildings, and scenic viewsheds. These Second-ary Conservation Aras are often best understood by the local residents who may be directly involved in their identification. Usually under most community land use regulations these resource areas are totally unprotected and are simply zoned for one kind of development or another.

A base map is then prepared on which the Primary Conservation Anas have been added to an inventory of lands which are already protected (such as parks, land trust preserves, and properties under conservation easement).Clear acetate sheets (or GIS Data Layer) showing each kind of Secondary Conservation Arare then laid on top of the base map in an order reflecting the community's preservation priorities (as determined through public discussion).

This "sieve mapping" process will reveal certain situations where two or more conservation features appear together (such as woodlands and wildlife habitats, or farmland and scenic viewsheds). It will also reveal gaps where no features appear.

Although this exercise is not an exact science, it frequently helps local officials and residents visualize how various kinds of resource areas are spatially related to one another, and enables them to tentatively identify both broad swaths and narrow corridors of resource land that could be protected in a variety of ways. Figure 3 illustrates a portion of a township map which has followed this approach.

The planning techniques which can best implement the community-wide Map of Potential Conservation Lands are **Conservation Zoning** and **Conservation Design**. These techniques, which work hand in hand, are described in detail below. Briefly stated, **Conservation Zoning** expands the range of development choices available to landowners and developers. And just as importantly, it also eliminates the option of creating full-density suburban sprawl layouts that convert all land within new developments into new lots and streets.

The second technique, **Conservation Design**, devotes half or more of the buildable land area within a development as undivided permanent conservation lands. Not surprisingly, the most important step in designing a new development using this approach is to identify the land that is to be preserved. By using the community-wide Map of Potential Conservation Lands a template for the layout and design of conservation areas within new developments, an interconnected network of conservation lands spanning the entire community is eventually created.

Figure 4 shows how the conservation lands in three adjoining developments has been designed to connect, and illustrates the way in which the Map of Potential Conservation Landsan become a reality.

Figure 5 provides a bird's-eye view of a landscape where an interconnected network of conservation lands has been gradually protected through the steady application of conservation zoning techniques and conservation design standards.

Figure 4 The conservation lands (shown in gray) were deliberately laid out to form part of an interconnected network of open space in these three adjoining subdivisions.

Figure 5 The end-result of applying the techniques described in this booklet is illustrated in this perspective sketch prepared by the Montgomery County Planning Commission.

## CONSERVATION ZONING

A "MENU" OF CHOICES

s mentioned previously the main reason that most new development in Michigan consists of nothing more than new lots and streets is that most communities have adopted a very limited planning model whose sole purpose is to convert natural lands into developed properties. Little if anything is asked in respect to conserving natural resources or providing neighborhood amenities (see Figure 9).

Communities wishing to discourage this type of development pattern need to consider modifying their zoning to require new development to set aside at least 50 percent of the buildable land as permanently protected conservation lands. The development potential that could normally be realized in this area is "transferred" to the remaining 50 percent of the buildable lands on the property.

Following this approach, a municipality would first calculate a site's yield using traditional zoning. A developer would then be permitted full density only if at least 50 percent (or more) of the buildable land is maintained as undivided conservation lands (illustrated in Figure 6: "Option 1"). Under certain conditions communities might also consider offering as much as a 100 percent density bonus for protecting 70 percent of the land (Figure 7: "Option 2").

It is noteworthy that the 36 village-like lots in Option 2 occupy less land than the 18 lots in Option 1, and that Option 2 therefore contributes more significantly to the goal of creating community-wide networks of conservation lands. The village-scale lots in Option 2 are based on traditional neighborhood design principles and are modeled after historic hamlet and village layouts. This type of development has proven to be particularly popular with empty nesters, single-parent households, and couples with young children.

Developers wishing to serve the large lot market have a "country properties" option (Figure 8: "Option 3"). Under this option up to 20 percent of the properties gross area (10 acres in this case) may be split into small lots. The average size of these small lots may be no less than two acres. The remainder of the property may remain as a single contiguous parcel or if area allows this parcel may be split into large lots a minimum of 25 acres in area..

Under conservation zoning, absent from this menu of choices is the conventional full-density development providing no conservation lands (Figure 9). Because that kind of development causes the largest loss of resource lands and poses the greatest obstacle to conservation efforts, it is not included as an option under this approach.

Figure 6

Option 1 Density-neutral with Pre-existing Zoning 18 Lots Lot Size Range: 20,000 to 40,000 sq. ft. 50% undivided open space

Figure 8

Option 3 County Properties

A maximum of 5 lots may be created on 10 acres

The remainder of the land remains as a single parcel or may be divided into lots 25 acres or greater in area

Figure 7 Option 2 Hamlet or Village 36 Lots Lot Size Range: 6,000 to 12,000 sq. ft. 70% undivided open space

Figure 9 The kind of subdivision most frequently created in Michigan is the type which blankets the development parcel with houselots, and which pays However, such a sketch can provide a useful estimate of a site's capacity to accommodate new houses at the base density allowed under zoning—and is therefore known as a "Yield Plan."

# CONSERVATION DESIGN, A FOUR-STEP PROCESS

esigning developments around the central organizing principle of land conservation is not difficult. However, it is essential that ordinances contain clear standards to guide the conservation design process. The four-step approach described below has been proven to be effective in laying out new full-density developments where all the significant natural and cultural features have been preserved.

Step One consists of identifying the land that should be permanently protected. The developer incorporates areas pre-identified on the community-wide Map of Potential Conservation Landsand then performs a site analysis in order to precisely locate features to be conserved. The developer first identifies all the Primary Conservation Amas(Figure 10). He then identifies Secondary Conservation Amas(Figure 11) which comprise noteworthy features of the property that are typically unprotected under current codes. These include: mature woodlands, greenways and trails, river and stream corridors, prime farmland, hedgerows and individual free-standing trees or tree groups, wildlife habitats and travel corridors, historic sites and structures, scenic viewsheds, etc. After "greenlining" these conservation elements, the remaining

Figure 11 Step One, Part Two Identifying Secondary Conservation Areas

Figure 10 Step One, Part One Identifying Primary Conservation Areas

Figure 12 Outline Potential Development Areas for Options 1 & 2

part of the property becomes the Potential Development Area(Figure 13).

*Step Two* involves locating sites of individual building envelopes within the Potential Development **Aa** so that their views of the conservation lands are maximized (Figure 13). The number of building envelopes is a function of the density permitted within the zoning district, as shown on a Yield Plan (Figure 9).

*Step Three* simply involves "connecting the dots" with streets and informal trails (Figure 14), while *Step Four* consists of drawing in the lot lines (Figure 15).

This approach reverses the sequence of steps in laying out conventional developments, where the street system is the first thing to be identified, followed by lot lines fanning out to encompass every square foot of ground into new lots. When communities require nothing more than "new lots and streets," that is all they receive. By setting community standards higher and requiring 50 to 70 percent conservation lands as a precondition for achieving full density, officials can effectively encourage the conservation of natural and scenic resources in their community. The protected conservation lands in each new development become building blocks that add new acreage to a community-wide network of interconnected conservation lands each time a property is developed.

# FREQUENTLY ASKED QUESTIONS

ABOUT CONSERVATION DEVELOPMENT DESIGN

**Q.** Does conservation planning/design involve a "takings"? A. No. People who do not fully understand this conservation-based approach to development may mistakenly believe that it constitutes "a taking of land without compensation." This misunderstanding may stem from the fact that conservation developments, as described in this booklet, involve either large percentages of undivided conservation lands or lower overall building densities.

There are two reasons why this approach does not constitute a "takings."

First, no density is taken away. Conservation zoning is fundamentally fair because it allows landowners and developers to achieve full density under the municipality's current zoning and, in some cases even to increase that density significantly through several different "as-of-right" options. Of the three options previously described, two provide for either full or enhanced densities. The other option offers the developer the choice to lower densities and increased lot sizes. Although conservation zoning precludes full density layouts that do not include conservation

lands, this is legal because there is no constitutional "right to sprawl."

Second, no land is taken for public use. None of the land which is required to be designated for conservation purposes becomes public (or even publicly accessible) unless the landowner or developer wants it to be. In the vast majority of situations, communities themselves have no desire to own and manage such conservation land, which they generally feel should be a neighborhood responsibility. In cases where local officials wish to provide community recreational facilities (such as ballfields or trails) within conservation developments, the community must negotiate with the developer for the purchase of that land on a "willing seller/willing buyer" basis. To facilitate such negotiations, conservation zoning ordinances can be written to include density incentives to persuade developers to designate specific parts of their conservation land for public ownership or for public access and use.

**Q.** How can a community ensure permanent protection for conservation lands?

**A.** The most effective way to ensure that the conservation of land in a new development will

remain undeveloped forever is to place a permanent conservation easement on it. Such easements run with the chain of title, in perpetuity, and specify the various uses that may occur on the property. These restrictions supersede zoning ordinances and continue in force even if legal densities rise in future years. Easements are typically held by land trusts and units of government. Sometimes adjacent property owners are also easement co-holder in conjunction with the local unit of government or land trust. Deed restrictions and covenants are, by comparison, not as effective as easements. and are not recommended for this purpose. Easements can be modified only within the spirit of the original agreement, and only if all the co-holders agree.

Q. What are the ownership, maintenance, tax and liability issues? A. Among the most commonly expressed concerns about developments with permanently protected conservation lands are questions about who will own and maintain the conservation land, and who will be responsible for the potential liability and payment of property taxes. The short answer is that whoever owns the conservation land is responsible for the above.

# **Q.** But who owns this land?

A. Ownership Choices

There are basically four options, which may be combined within the same development where that makes the most sense.

1. Individual Landowner

At its simplest level, the original landowner (a farmer, for example) can retain ownership of 70 to 100 percent of the conservation land to keep it in the family. (In these cases up to 30 percent of the conservation lands could be reserved for common neighborhood use by development residents.) That landowner can also pass this property on to sons or daughters, or sell it to other individual landowners, with permanent conservation easements running with the land and protecting it from development under future owners.

#### 2. Homeowners' Associations

Most conservation land within developments is owned and managed by homeowners' associations (HOAs). A few basic ground rules encourage a good performance record. First, membership must be automatic, a precondition of property purchase in the development. Second, zoning should require that bylaws give such associations the legal right to place liens on properties of members who fail to pay their dues. Third. facilities should be minimal (ballfields and trails rather than clubhouses and swimming pools) to keep annual dues low. And fourth, detailed maintenance plans for conservation areas should be required by the community as a condition of approval. The community should have enforcement rights and may place a lien on the property should the HOA fail to perform their obligations to maintain the conservation land.

#### 3. Land Trusts

Although homeowners' associations are generally the most logical recipients of conservation land within developments, occasionally situations arise where such ownership most appropriately resides with a land trust (such as when a particularly rare or significant natural area is involved). Land trusts are private, charitable groups whose principal purpose is to protect land under its stewardship from inappropriate change. Their most common role is to hold easements or fee

simple title on conservation lands within new developments and elsewhere in the community.

To cover their costs in maintaining land they own or in monitoring land they hold easements on, land trusts typically require some endowment funding. When conservation zoning offers a density bonus, developers can donate the proceeds from the additional "endowment lots" to such trusts for maintenance or monitoring.

#### 4. Municipality or Other Public Agency

In special situations a local government might desire to own part of the conservation land within a new development, such as when that land has been identified in a Land Use Plan as a good location for a neighborhood park or for a link in a community trail network. Developers can be encouraged to sell or donate certain acreage to communities through additional density incentives, although the final decision would remain the developer's.

## 5. Combinations of the Above

As illustrated in Figure 18, the conservation land within new developments could involve multiple ownerships, including (1) "non-common" conservation lands such as cropland retained by the original farmer, (2) common conservation lands such as ballfields owned by an HOA, and (3) a trail corridor owned by either a land trust or by the community.

#### Tax Concerns

Property tax assessments on conservation developments should not differ, in total, from those on conventional developments. This is because the same number of houses and acres of land are involved in both cases (except when part of the conservation lands is owned by a public entity, which is uncommon). Although the conservation lands in conservation developments is usually taxed at a lower rate because easements prevent it from being developed, the adjacent lots usually are taxed at a higher rate since their location next to permanently protected conservation lands usually result in them being more desirable.

**Q.** How does this conservation approach differ tion zoning can protect from "clustering"?

**A.** The conservation approach described in the previous pages differs dramatically from the kind of "clustering" that has occurred in many communities throughout Michigan over the past several decades. The principal points of difference are as follows: *Higher Percentage and Quality of Conservation lands* 

In contrast with typical cluster codes, conservation

zoning establishes higher standards for both the quantity and quality of conservation lands that is to be preserved. Under conservation zoning, 50 to 70 percent of the unconstrained land is permanently set aside. This compares with cluster provisions that frequently require only 25 to 30 of the gross land area be conserved. That minimal land area usually ends up including all of the most unusable land as conservation lands, and sometimes also includes undesirable, left-over areas such as stormwater management facilities and land under high-tension power lines.

#### Conservation lands Pre-Determined to Form Community-wide Conservation Network

Although clustering has at best typically produced a few small "green islands" here and there in any community, conservation zoning can protect

Figure 16 Various private and public entities can own different parts of the open space within conservation subdivisions, as illustrated above.

blocks and corridors of permanent conservation lands. These areas can be pre-identified on in the community's Map of Potential Conservation Lands so that each new development will add to rather than subtract from the community's conservation lands acreage.

#### Eliminates the Standard Practice of Full-Density with No Conservation lands

Under this new system, full density is only achievable for layouts in which 50 percent or more of the unconstrained land is conserved as permanent, undivided conservation lands. By contrast, cluster zoning provisions are typically only optional alternatives within ordinances that permit full density, by right, for standard "cookie-cutter" designs with no conservation lands.

**Q.** How doesidential values in conservation developments compare to conventional developments?

**A.** Another concern of many people is that homes in conservation developments will differ in value from those in the rest of the community. Some believe that because so much land is set aside as conservation lands, the homes in a conservation developments will be prohibitively priced and the community will become a series of elitist enclaves. Other people take the opposite view, fearing that these homes will be smaller and less expensive than their own because of the

more compact lot sizes offered in conservation developments.

Both concerns are understandable but they miss the mark. Developers will build what the market is seeking at any given time, and they often base their decision about selling price on the character of surrounding neighborhoods and the amount they must pay for the land.

In conservation developments with substantial open space, there is little or no correlation between lot size and price. These developments have sometimes been described as "golf course communities without the golf course," underscoring the idea that a house on a small lot with a great view is frequently worth as much or more than the same house on a larger lot which is boxed in on all sides by other houses.

It is a well-established fact of real estate that people pay more for park-like settings, which offset their tendency to pay less for smaller lots. Successful developers know how to market homes in conservation developments by emphasizing the conservation lands. Rather than describing a house on a half-acre lot as such, the product is described as a house with 20 and onehalf acres, the larger figure reflecting the area of conservation land that has been protected in the development. When that conservation area abuts other similar land, as in the township-wide conservation lands network, a further marketing advantage exists.

# RELATIONSHIP OF THE BETTER DESIGNS

Successful communities employ a wide array of conservation planning techniques simultaneously, over an extended period of time. Communities should continue their efforts to preserve special properties in their entirety whenever possible, such as by working with landowners interested in donating easements or fee title to a local conservation group, purchasing development rights or fee title with county, state or federal grant money, and transferring development rights to certain "receiving areas" with increased density. While these techniques can be effective, their potential for influencing the "big picture" is limited. The conservation approach outlined above offers great potential because it:

- 1. does not equie public expenditure of funds
- 2. does not depend upon landowner charity
- 3. does not involve complicated regulations for shifting rights to other parcels
- 4. does not depend upon the cooperation of two or more adjoining landowners to make it work

The conservation planning/design approach offers communities a practical way of protecting large acreages of land in a methodical and coordinated manner.

## The Code of Country Living

Settlers on the Illinois prairie lived by a code suited to their own livelihood and lifestyle in the rural countryside. Though that way of life has evolved over two centuries, there remains a code, a way of living, that rural Illinois residents still honor.

Living in the country can be a wonderful way of life—if your expectations are in-line with reality. Reality seldom measures up to the romanticized version of almost any idea or ideal—as is frequently discovered by those who move from an urban setting to the country. People often intend to get away from it all and enjoy the serenity of an agrarian countryside. What they'll likely find, however, is that they are only trading the benefits and drawbacks of city living for those of the country.

In rural Illinois, you'll find working farms. You'll also find a level of infrastructure and services generally below that provided through the collective wealth of an urban community. Many other factors, too, make the country living experience very different from what may be found in the city.

This booklet is provided to help you make an informed lifestyle decision about purchasing a home or a homesite in rural Illinois. Though it cannot convey the entirety of the understanding borne from a lifetime of rural living, it can give you a glimpse of what it takes to live by what might be called the Code of Country Living.

Access

You'll enjoy the lower traffic volumes on rural roads. That makes walking more enjoyable and allows you to observe the growing crops and the beautiful sunrises. The major purpose of the road—to provide a way

to get to and from your rural property—will vary with road types. Changing conditions and generally lower design level roads mean that you, your guests and emergency service vehicles will not necessarily have easy access at all times.

#### **Rural Roads**

Don't expect rural roads to be maintained at the same level as city streets. Counties, townships and road districts have primary responsibility for road maintenance in rural areas. Some roads may be privately owned requiring private maintenance funding. Seldom do rural roads include the amenities found in urban settings such as: wide lanes, curb and gutter, striping and lighting. And, the funds to maintain those roads will come primarily from the property taxes you and your neighbors pay.

Narrow roads and bridge weight limits often restrict travel. Large construction vehicles cannot navigate in some areas. If you plan to build, it's best to check out construction access well in advance.

Gravel roads generate dust and dings. Some road jurisdictions treat gravel roads to suppress the dust when traffic levels reach specific volumes, but dust is still a fact of life for many rural residents. Loose gravel on these roads regularly chips vehicle paint, at times may crack windshields and can pose dangerous travel conditions. If your homesite is located along a gravel road, know that dust will invade your home and your vehicles. Whatever the design of your road, don't expect that it will be improved in the foreseeable future. Check carefully with officials of the road jurisdiction to verify any claim that a road will be paved, bridges replaced, or other improvements made in the near term.

#### Weather Impacts

Illinois' fluctuating weather conditions can destroy roads. Midwestern spring freeze/thaw cycles leave low-grade roads subject to heavy damage and can even temporarily close some roads. Vehicle weights are often severely limited during the spring thaw period. In the summer, the hot sun can soften oil and chip road surfaces leaving them subject to damage by traffic and causing oil splatters on vehicles.

In extreme winter weather, rural roads can become impassable. The Illinois prairie is subject to drifting snow that closes roads, causes delays and creates serious travel hazards. Depending on the degree of drifting, it could be days before roads are cleared. Freezing rain, too, can create extremely dangerous travel conditions. Few rural road jurisdictions can afford the widespread use of salt to fight icy conditions.

Roadway flooding is not uncommon. Illinois' abundance of rivers, creeks and waterways makes its rural areas prone to roadway flooding. Heavy rains in flatland areas can easily cover roads with water, blocking or even destroying them.

#### **Private Drives**

Access to or from public roads is regulated by the state, county or road district jurisdiction responsible for the road. If planning to build, be sure to check in advance with the proper officials about authorization and placement of private drives and culverts.

### **Emergency Service Access**

Response times of emergency service providers (sheriff, fire fighters,

ROAD

medical care, etc.) will likely be longer than in the city. Distances traveled and the volunteer nature of most rural services can add to that response time. Under some extreme conditions, you may find that emergency response is slow and expensive. A 9-1-1 emergency call-in service may not be available in all areas.

A few rural areas are not covered by fire protection or ambulance services. Besides the obvious problems that could create, your property insurance premiums might also be higher because of it.

#### Easements

The legal aspects of access can cause problems, especially if you gain access across property belonging to others. Get legal advice prior to purchasing and understand the easements that may be necessary when these questions arise.

## **Pickups & Deliveries**

Building a residence in a rural area may be more expensive and time consuming due to delivery fees and the time required for contractors and construction workers to reach your building site.

School buses generally can reach most rural homes, though long private lanes or rural subdivision settings may force school children to walk to the pickup site. And those trips to school can be long. Consolidation of school districts in rural areas means your children's school could be half a county from your home. Learn which school district serves your area.

Mail delivery is generally available in all rural areas though timing may suffer in some locations.

Direct, daily newspaper delivery is not always available in rural areas. US Postal delivery of newspapers is an option but generally causes a oneday delay. Check with the newspaper of your choice before assuming you can get same-day delivery.

Standard parcel and overnight package delivery in the country may vary from city standards. Check with the carrier to find what service level can be expected.

# Utilities

The fresh air and sunshine in the country is plentiful and free. And, when utilities are functioning properly, they help to make life in the country as comfortable and modern as anywhere else. But, water, sewer, electric, telephone and other utilities may be unavailable or operate at lower than urban standards – and they can often cost you more

## **Locating Utilities**

In order to get electric power or other utilities to your home site, it may be necessary to cross property owned by others. It is important to make sure that the proper easements are in place or can be secured to allow lines to be built to your own property.

Electrical power lines, telephone lines and pipelines may cross over, under, or nearby your property. Be aware of easements to the property and those nearby and what they allow the utility providers to do in the way of access, maintenance and expansion.

At least 48 hours prior to doing any digging, call *JULIE* (Joint Utilities Locating Information for Excavators) in order to locate underground utility lines. You can reach JULIE 24 hours a day, seven days a week at 800-892-0123.

### Water Supply

You will have to locate a supply of potable water adequate to serve your needs. The most common method is through the use of a water well. Permits for wells may be required by the county health department or a local water authority serving your area. The cost for drilling and pumping can be considerable. Be sure to use a licensed well driller. The quality and quantity of well water can vary significantly from location to location and from season to season. Mineral, bacterial and other quality issues should be measured and then determine whether practical solutions exist for all of the problems you might discover.

> In some areas of the state water wells are wholly impractical or unreliable. Because of your absolute reliance on a good supply of water, it is strongly advised that you research this issue carefully before purchasing!

Most often well water will require some form of treatment. Having a water softening system is almost always advisable. In extreme cases, some form of chemical treatment may be required to deal with high levels of bacteria.

Some areas of the state are served by water districts. These districts supply potable water through a rural network of supply lines. In these areas, certain additional taxes and/or fees may be required. Expect to pay a tapping fee. You may also find that your monthly cost of service can be more expensive when compared to urban systems.

As a last resort, your potable water may need to be trucked to your property and stored in a tank or cistern. Depending on the supplier and their distance from your property, buying and trucking water could prove to be the most expensive and least reliable method in the long run.

#### Sewer & Septic

Sewer service is rarely available. If it is, it may be relatively expensive to connect to the system and routine fees could be relatively high compared to city rates.

If sewer service is not available, you will need to use an approved septic system or other waste treatment process. These can add substantial cost to establishing your homesite. The type of soil you have available for a leach field will be very important in determining the cost and function of your system. Ask for planning assistance from the County Health Department if one exists and have existing systems checked—or a new system installed—by a reliable installer.

Septic system requirements vary. Some counties may have significant regulations stipulating the type and size of the septic or treatment system you must have. Conditions could dictate that a sand filter system be installed – an expensive addition to the cost of the home. In some cluster housing settings or on certain soil types, septic systems may not be allowed at all.

Locating the septic system requires careful planning. Sufficient area will be needed for locating the septic tank and drain field a suitable distance from the residence. Floodplains, wetlands, trees and manmade structures may limit where the septic system can be placed. Also, access will be needed to the septic tank for future clean out operations. Location of the septic system in relation to wells is also an important consideration.

#### Telephone

Telephone communications can pose certain problems. Small, local area phone service suppliers may not provide the most modern telecommunications equipment limiting your options. It could be difficult to obtain a second line for phone, FAX or computer modem uses. Even cellular phones will not work well in all rural areas because of the often greater distances to cell phone towers.

Links to Internet provider services via phone line may require a long-distance phone connection. Often older rural telecommunications systems restrict computer modems to operating at less than top speeds. Not all rural communities have a local Internet access provider, though many school systems and libraries do offer some connection options.

### Electricity

Electric service is generally available to all rural areas. However, a power company asked to serve some remote areas may demand a share of the infrastructure cost be borne by the user. It is important to determine the proximity of an electrical power supply. It can be very expensive to extend power lines to remote areas.

> Electric power may not be available in a three–phase service configuration. If you have special power requirements, it is important to know what level of service can be provided and at what cost.

In addition to a monthly charge for energy consumed, the cost of electric service usually includes a fee to hook into the system. Some utilities charge further for the cost of establishing

service lines and poles on your property. Check to see what supplier provides power to the area then consider all costs before making a decision to purchase property in the country.

Power outages can occur with more frequency in rural areas than in urban settings. A loss of electric power can interrupt your well, furnace, and other appliances dependant on electrical power. If you live in the country, it is important to be prepared to survive for several days or longer in severe cold without electrical power. Depending on the duration of the outage, you might also lose food in freezers or refrigerators. Such outages or current spikes can cause problems with computers and other home electronics.

#### Gas

Natural gas may not be available. You could, instead, rely on electric power which is often more expensive (for heat-producing appliances.) The common alternative is having Liquid Propane Gas or heating oil delivered by truck and stored in a tank on your property. The cost of such fuel is often higher on a BTU basis than is natural gas. If relying on gas deliveries,

you must be certain that your supply is adequate to get you through winter's periodic snow storms when access for replenishing supplies may be limited.

Gas appliances may need to be converted. If you choose to use Liquid Propane Gas as your energy source, all appliances set up to operate on natural gas will need to be converted to operate on the Liquid Propane Gas.

### Trash & Recycling

Routine trash removal may not be available in all rural areas. Where it is, it most often requires a separate fee. Trash pickup is seldom provided as a government service in rural areas and is not covered by the taxes you pay. It is illegal to create your own trash dump, even on your own land. Burning of trash may be prohibited and risks fire damage to mature crops and nearby buildings. In some cases, your only option may be to haul your trash to the landfill yourself.

Recycling may be difficult in rural areas. Recycling pick-up is not likely available and rural areas generally have few recycling centers.

# Property

Property ownership is a treasured right in rural areas. The wide open expanses there generally allow you to own a larger tract than you might otherwise be able to in urban areas. And the open space can give you a sense of freedom not available in a crowded city

setting. However your rural property can be impacted by a myriad of issues—some commonly shared in urban areas, and some quite different.

## Zoning

Building a home may not be possible on all sites. The area may not be suitable for building or may not be zoned residential. Where there is zoning you must check with the county or township zoning, planning and/ or building department(s) to know whether a parcel of land may be developed. A building permit may be required. In those counties that are zoned, that requirement is likely for all structures and improvements. Check with the county or township zoning, planning and/or building department(s) for additional information.

Zoning can be a mixed bag. Only about half the counties in Illinois are zoned. In some unzoned counties, townships have established zoning. While zoning imposes limitations, it also provides some safeguards against undesirable use of neighboring property. In those counties or townships which are not zoned, there may be virtually no local restriction on what your adjoining neighbors may do on their property—regardless of its impact on you and the value of your property.

The view from your property may change. Nearby properties will probably not remain as they are indefinitely. Check with the county or township zoning, planning and/or building department(s) to find out how

the properties are zoned and to see what future developments may be planned.

City zoning may apply in rural areas. In un-zoned counties, a municipality that is zoned may generally impose its zoning regulations for up to one and one half miles outside its corporate limits.

#### Easements

Easements should be considered. These could limit how you can use your property and may require you to allow construction rights-of-way across your land. Roads, railroads, habitat protection, view sheds, power lines, gas lines, water lines, and sewer lines are a few of the things for which easements can be established.

Be aware of easements on nearby parcels, too. Learn what the easement allows the easement owner to do in the way of access, maintenance and expansion and check for limits the easement may imposed on the use of your own property. Not all contracts are in writing. There may be verbal commitments to easements that are not of record.

#### **Mineral Rights**

The mineral rights under your property may be owned by someone else. Owners of mineral rights generally have the ability to change the surface characteristics in order to extract their minerals. It is very important to know what minerals may be located under the land and who owns them. Much of the rural land in Illinois can be used for coal or aggregate mining or for oil drilling—however, a special review by the county board is usually required.

#### **Property Lines & Fences**

Respect private property rights. Many people are unaware of property boundaries when first arriving in the area. It is your responsibility to know who's land you are on – whether or not it is fenced.

You may be provided with a plat of your property, but unless the land

has been surveyed and pins placed by a licensed surveyor, you should not assume that the plat is accurately reflected by your current boundary markings.

What appear to be boundary fences are not necessarily accurately placed. Some merely approximate those boundaries. A survey of the land is the only way to confirm the location of your property lines. The Illinois law of "Adverse Possession" could actually cause you to loose some land to an adjacent owner over a period of years if property boundaries are not properly determined and defended.

What you think of as your neighbor's fence may cost you money. Illinois' fence law requires that adjoining landowners share in a "just proportion" of the cost of constructing and maintaining a property line fence. That applies despite the fact that you may have no use for nor desire for the fence.

#### Local Covenants

Many rural subdivisions have covenants that limit the use of the property. It is important to obtain a copy of the covenants (or confirm there are none) and make sure you can live with those rules. Not having a covenant doesn't eliminate all problems, it simply means you'll lack a powerful tool that could be used to settle disputes between neighbors.

Homeowners' Associations (HOAs) in some rural subdivisions are required to take care of common elements, private roads, open space, etc. A dysfunctional homeowners' association or poor covenants can cause problems for you and even involve you in expensive litigation. Dues are almost always a requirement for those residing in areas served by an HOA. The by-laws of the HOA should tell you how the organization operates and how the dues are set.

#### Floodplains & Drainage

Watch for areas designated as "floodplains." Local, state and federal regulations may prohibit or limit the types of structures built in floodplains. If allowed at all, certain—often expensive—modifications to the design may be required. Also, your mortgage lender could require you to purchase government flood insurance.

Your drainage practices must conform with the Illinois Drainage Code. Generally, landowners must accept the natural flow of water onto their property and discharge it from their property at its natural point and rate of flow. Contact your county Soil and Water Conservation District for information.

Maintenance of others' drainage structures could impact you. If there is a drainage ditch or underground drainage tile crossing your property there is a good possibility that the owners have the right to come onto your property to maintain it. Heavy equipment might be used leaving considerable damage. While Illinois law generally requires compensation, you may have to negotiate settlement for damages. On the other hand, if you disturb the drainage ditch or tile during construction or otherwise you could be held responsible for damages that result to crops and property.

Your property may be situated within a drainage district. If so, your property would be subject to the taxes levied by the district for maintenance of local drainage systems.

### **Fire Protection**

Fire protection is a serious property issue. Though most rural areas of the state are served by a volunteer fire protection unit, some pockets remain without any coverage. Buildings and other structures on property that is not within a fire protection district may be subject to higher insurance rates and be at greater risk in the event of fire than those within a district. As a general rule, property protected by a volunteer fire protection unit is subject to higher insurance rates than that served by a full-time professional force.

# Nature

The country is prized for giving its residents the ability to witness the flora and fauna of nature firsthand. But, when the elements and earth turn unfriendly, rural residents can experience more problems than their city cousins.

## Soils

Illinois soils vary from deep, rich silt loam to shallow, rocky clay. Each requires special building considerations. Some may hinder the construction of basements due to drainage restrictions. Building in many areas requires an engineered foundation. You can learn the soil conditions on your property if you have a soil test performed. Check with a qualified contractor for foundation needs which will influence building design.

## Storms & Wind

Tornadoes and other severe storms are not unique to rural areas, but you will find that few rural areas are provided with the advanced warning systems found in many urban communities.

The predominant wind direction in Illinois is from southwest to northeast. Situate and plan your homesite accordingly.

## Flooding

The lay of the land can tell you where the water will flow. However, runoff from the flat prairie lands of Illinois is often difficult to predict. "Sheet" drainage over flat land may cause stormwater to spread over wide areas. The lack of significant slope also makes the area slow to drain. Property owners who want to fill in low areas may first be required to obtain proper local, state, and federal permits and provide for wetland mitigation.

Flash flooding can occur during the heavy rains of the spring or summer months, turning a dry low-lying area into a lake. Spring run-off can cause a small creek to become a fast-flowing river. Consider this before planning your building site.

Residents sometimes use sand bags to protect their homes. Local governments are not generally obligated to provide sand bags, equipment or people to protect private property from flooding.

#### Animals

Wild animals can make wonderful neighbors. However, even the most attractive of such animals can cause serious problems. Rural development encroaches on the traditional habitat of coyotes, deer, ticks, raccoon, opossum and other animals that can be dangerous and you need to learn how to deal with them. In general, it is best to enjoy wildlife from a distance.

Wild animals can pose serious threats to pets, livestock, vegetation, and vehicles. Waterfowl can be particularly damaging to vegetation along flyways. Deer are ubiquitous in Illinois. They damage vegetation and often bolt across a road unexpectedly causing traffic accidents. Fox and coyote can be serious threats to livestock and pets. Raccoon have little fear of human surroundings and are insistent visitors to anything that resembles food — no matter how close to your home or well protected. Snakes, opossum, field mice, groundhogs and skunks are some of nature's other inhabitants in rural Illinois.

Dog packs pose a threat to pets, livestock, and potentially to humans. These are often formed by free roaming pets, stray dogs or even coydogs (the offspring of coyotes and domesticated dogs). The packs roam freely through the countryside looking for food. Where dog pack problems can be identified, counties may offer some form of assistance in eradication or monetary compensation for damages.

# Agriculture

Through hard work and perseverance of the early settlers, the Illinois prairie has become one of the richest food-producing areas on earth. Its rich soils and abundant rainfall are unique to the Midwest making this a vital agricultural region on a global scale. Illinois farmers make their living from the land—making their good stewardship of the land an integral part of their livelihood. Owning rural land means learning how to care for it. It also means your neighbors may be farmers. There are a few things you need to know about Illinois agriculture.

## This is Farm Country

Agriculture is an integral part of Illinois. If you choose to live in the country, you choose to live among the farms of our rural countryside. Do not expect government to intervene in the normal day-to-day operations of your agri-business neighbors. In fact, Illinois has *"Right to Farm"* legislation that helps to protect established farm operations using good management practices from nuisance and liable suits. It helps enable them to responsibly continue producing food and fiber for the nation and the world.

Having a rural residence means you're part of farm country. Here, farmers sometimes work around the clock. Often that work involves the use of large farm implements. Your daytime and night-time peace and quiet can be disturbed by common agricultural practices, especially during the spring and fall field work seasons.

### Sights, Smells and Sounds

Tillage, harvesting, haying and other operations can result in dust, especially during windy and dry weather. That dust can easily invade your home and vehicles.

Some farmers occasionally burn their ditches and grassy areas to keep them free of weeds or to promote growth of plants native to the Illinois prairie. This burning may create smoke that you could find objectionable.

Crop production and protection products are used in growing Illinois' abundant and healthy crops. These products are applied by licensed applicators who take precautions to properly handle and apply them. Learning more about the safety of these products can be as simple as contacting the University of Illinois Extension Service.

Animals and their manure can cause objectionable odors. Farmers use best management practices to limit that odor and follow government guidelines during field application to minimize odor impacts. Manure serves as a valuable source of organic fertilizer and its use lowers dependency on synthetic nutrients. Still, the uninitiated nose may find it disagreeable. Check carefully before buying a rural homesite to be sure it is located a reasonable distance from livestock operations. Keep in mind prevailing winds.

### Weed Control

Before buying land you should know whether it has noxious weeds that you may be required to control. Some plants are even poisonous to livestock, pets or humans. Illinois' "Noxious Weed Law" requires the land owner to control or eradicate certain weeds on their own property.

### **Slow Moving Vehicles**

Farm equipment may slow your travel on rural roads. These large, slow-moving pieces of machinery help to make Illinois one of the leading food producing areas of the world. Farm tractors generally move at top speeds of from 15 to 20 miles per hour so you can over take them quickly from the rear. Watch for them and be patient—farmers will let you pass as soon as it's safe for them to pull over.

Look for the Slow Moving Vehicle (SMV) emblem displayed on the rear of farm equipment. The SMV emblem has a red-orange fluorescent triangle at its center surounded by a highly reflective red border. That's a sign you need to know when driving rural roads. Farm equipment and certain other slow moving vehicles are required to display the SMV emblem when they share the road with other traffic. It warns you to slow down. Learn to recognize it and heed its warning.

To protect the meaning and significance of the SMV emblem for traffic safety, Illinois law prohibits the use of that emblem for other purposes. For instance, it is illegal to use the SMV emblem as a lane marker or gate sign.

# Government

Illinois has more than 6,600 units of local government—far more than any other state in the nation. In rural areas, your home may be found to be in a dozen or more taxing districts—each one providing some service and taxing your property to fund it. That fact generates a number of things you should consider.

#### **Property Taxes**

Illinois is a high property tax state—in part, due to its reliance on local government. Local government relies heavily on the property tax for its revenue—especially where sales taxes and other revenue sources are not available to special purpose governmental units. That means rural property owners often incur a large share of the cost of providing local government services, especially in the less-densely populated areas.

#### **Keeping Track**

Illinois counties most often encompass dozens of local governmental units. It is sometimes difficult to know which unit to turn to for a particular service or to address a particular problem. Unlike urban areas in which the city is the primary provider of most services, in rural areas, different services may each be provided by a separate unit of government. Exercising your civic duty to keep an eye on all those units can be a daunting task.

#### Service Levels

Few rural governmental units have the financial resources of their urban counterparts. Generally, fewer services can be offered and the level of service may be less than that found in cities.

# Neighbors

Illinois' rural residents are generally very friendly and open. Neighborliness is practiced and expected in return. They do ask, however, that privacy and private property rights be respected.

#### Interact

Get to know your new neighbors. Don't wait—meet those folks living near your new home as soon as you decide to buy in the country, or even before. Knowing your neighbors and letting them get to know you will speed your acceptance as a new arrival in the neighborhood and boost your own comfort level.

Learn to wave to your neighbors—it's the country thing to do. Whether you meet them on the road or driving by their home, be sure to give a friendly wave. You'll come to recognize and appreciate each neighbor's individual style.

#### Be a Good Neighbor

Keep your property neat. The vast majority of farmers and rural residents take pride in keeping their homesites presentable. Be a good neighbor and do your share.

Become a part of the neighborhood. Don't merely keep a house in the country while spending your time and money in some distant urban or commercial center. Get involved in local community events and organizations and patronize the local businesses.

# Information

Where do you turn for more information about the considerations noted in this booklet? Here

are some very general suggestions. Of course,

resources will differ by locale so you may need to do a little research on your own.

Not all services listed are available in all counties. When in doubt, start with the county Farm Bureau or the University of Illinois Extension Service for general information about rural areas.

#### Local Government

- County (or Township) Office of Zoning, Planning and/or Building
- County Recorder of Deeds
- County Highway Department
- Township (or Road District) Highway Commissioner
- Local Drainage District
- County Health Department
- County Animal Control Unit
- County Sheriff's Office
- County Emergency Services and Disaster Agency/Officer
- County & Township Assessors
- Soil and Water Conservation District

#### Businesses

- Utilities
- Fuel contractors
- Refuse/waste haulers
- Building contractors
- Realtors

#### Other

- University of Illinois Extension Service
- Local Postmaster

#### Associations

- County Farm Bureau®
- Local Chamber of Commerce

APPENDIX H

# VILLAGE OF REDGRANITE NOTICE OF PUBLIC INFORMATIONAL MEETING & PUBLIC HEARING COMPREHENSIVE PLAN

PLEASE TAKE NOTICE THAT the Village of Redgranite Plan Commission will hold a public hearing on the proposed adoption of the Village of Redgranite Comprehensive Plan 2025. The public informational meeting will be held on Monday, June 19, 2006 at 6:30 P M. at the Redgranite Municipal Building located at 161 Dearborn Street, Redgranite. WI: public hearing to follow at 6:45 PM. The Redgranite Village Board will take action following the public hearing on the proposed adoption of the Village of Redgranite Comprehensive Plan 2025 at the next monthly Village Board meeting on June 20,2006. The Comprehensive Plan is a statement of public policy concerning

The Comprehensive Plan is a statement of public policy concerning the conservation and development of the village. The plan provides a guide to where future growth and development should occur within the Village over the next 20 years. When the village makes future decisions concerning land use development, the plan will be consulted. The plan inventoried and analyzed the village's physical setting, natural features,. land use, population figures, economics, housing stock, transportation, and community facilities. Using these inventories and plan's goal and objectives, a preferred land use plan was developed for the Village of Redgranite.

The Village of Redgranite Comprehensive Planning Committee, together with the East Central Wisconsin Regional Planning Commission, worked to develop the *Village of Redgranite Comprehensive Plan 2025* within a 4 year timeframe. If anyone would like additional information, please contact Madonna Berube, Village Clerk/Treasurer at (920) 566-2381 or Kathy Thunes at East Central Wisconsin Regional Planning Commission, phone: (920) 751- 4770 email: kthunes@eastcentralrpc.org.

Copies of the proposed *Village of Redgranite Comprehensive Plan 2025 are* available for review at the following locations:

- Redgranite Municipal Building, 161 Dearborn Street in Redgranite, WI.
- Redgranite Public Library, 135 W. Bannerman Avenue in Redgranite, WI.
- University of Wisconsin Extension Offices (Room 34 in
- Waushara County Courthouse), 209 S. St. Marie Street, Wautoma, WI; and
- The East Central Wisconsin Regional Planning Commission. 132 Main Street in Menasha, WI.

If special arrangements are necessary to accommodate individuals with disabilities , please ontact Madonna Berabe, VIIIage Clerk/Treasurer at (920) 566-2381 at least 2 days prior to the hearing.

STATE OF WISCONSIN WAUSHARA COUNTY ,	I, Virginia M. #### DATE: 5/8/2006

- TO: Debbie Paavola, Department of Aging Glenn Johnson, Department of Human Services Tom Dahlke. Highway Department Scott Schuman. Parks Department David Peterson, Sheriff's Department Fred Kaiser, Veterans Service Office Ruth Zouski. Corporation Counsel Deb Behringer. Administration
- RE: Drafts Municipal Land Use Plans

As many of you may be aware, the State of Wisconsin is requiring all municipalities who administer land use regulations to develop comprehensive land use plans for their respective communities by the year 2010. Some of you may know this requirement as "Smart Growth" legislation. Waushara County has contracted with East Central Wisconsin Regional Planning Commission to help with the preparation of these plans in most of the municipalities.

The first three communities have completed drafts of their plans, which are now available for reviewal and comment. They are the City of Wautoma. the Village of Redgranite, and the Town of Dakota. These draft plans (about 300 pages each) are on file in the Waushara County Land Conservation and Zoning Office. Copies are also on file at the local libraries and at the UWEX Office. Public hearings will be held on June 12<sup>°°</sup> for the City of Wautoma Plan, June 19<sup>°°</sup> for the Village of Redgranite Plan, and June 10<sup>°°</sup> for the Town of Dakota Plan.

Since each of your Departments (except for Corporation Counsel and Administration) are mentioned in these plans, I am attaching a copy of the summaries of these plans, for your reviewal and comment. You may stop up in our office to look at the entire plans, if you so choose. <u>After you look the summaries over, please initial this cover page and route to the next Department on this letter.</u>

If you wish to make comment in writing, prior to the public hearings, please address your comments to:

East Central Wisconsin Regional Planning Commission 132 Main Street Menasha, WI 54952-3100

You can also e mail them at staff@eastcentralrpc.org

Please indicate which plan you are commenting on.

There are many more municipal plans in the works, and the County will also have to prepare a comprehensive land use plan, so we will try and follow this same reviewal procedure for all of them, as well. If you have any questions about this process, feel free to contact me.

Mark Schumacher, Director Waushara County Land Conservation & Zoning

DATE: 5/12/2006

- TO: East Central Wisconsin Regional Planning Commission 132 Main Street Menasha, WI 54952-3100
- RE: Draft Comprehensive Plan 2025 Village of Redgranite

This office is in receipt of the afore-mentioned comprehensive plan, and would offer comments about this draft prior to the public hearing which has been scheduled. The comments listed below are referenced to the summary found within the implementation section of this plan, beginning on page 10-15, and are as follows:

- Page 10-25 Monitor on-site waste disposal systems As your strategies indicate on page 7-59, Waushara County is requiring mandatory maintenance every 3 years on all systems installed since 1999. However, we are also requiring all existing systems to enter into this program when any existing home is replaced or substantial additions are done to the existing home. Eventually, all the systems will be under this maintenance program, and is about all we can do, given existing staffing and funding limitations. Regarding the suggestion that the County require on-site testing as part of ownership transfers, this is more of a challenge. Existing laws would have to be changed, and even then, what do you do in the winter during frozen ground conditions? As part of any evaluation, soil conditions are essential. Do you hold up the sale during winter months? Do you put money in escrow? If so, how much? Endless questions with no easy answers. A simple proposal, but a very complex answer.
- Page 10-25 Minimize nutrient contributions from private on-site septic systems

   We prohibit residential development on sites which can only support holding tanks. Do you want more than this?
- 3. Page 10-31 Partner with the WDNR, county & other municipalities to control specific problem (invasive) species on a county wide basis Our Land Conservation Department is trying to get funding and local support for an area specialist who could help lake organizations with the problem. Support for this position from local municipalities like the Village of Redgranite are appreciated. This section also recommends protecting the Willow Creek. It would be nice to know exactly what the Village would like the County to do to achieve this strategy.

4. There also might be some request to adopt extraterritorial authority that would grant the Village the authority to review land division proposals and make planning decisions within the 1.5 miles of the city. Waushara County would not oppose adopting this authority. However, if the Village is proposing adopting extraterritorial zoning authority (which is completely different from extraterritorial platting authority), that is a completely different matter. I would strongly oppose any such action. Ask any of the very few municipalities who have this – it does not work, is a pain to administer and is extremely inconvenient for all the affected landowners. I know – we have this with the City of Berlin, and the only reason it works reasonably well there is we work very hard with the City to make it so. In most situations that does not happen.

We commend the local citizens who volunteered their time in drafting this document, and we appreciate receiving the draft plan and the opportunity to comment, and look forward to a continued working relationship with East Central Wisconsin Regional Planning Commission and the Village of Redgranite.

Please feel free to contact me, if you or the Village have any questions about these comments.  $\int \int$

Re: Village of Redgranite Comprehensive Plan 20205

Dear Mark:

On behalf of the Village of Redgranite we are responding to your comments dated May 15, 2006 regarding the Village of Redgranite Comprehensive Plan 2025.

- 1. Page 10-25 Monitor on-site waste disposal systems. Preserving groundwater supplies in regard to quality and quantity are important issues to the Village. Therefore the Village encourages the County to pursue this strategy. The Village also recognizes that it will be a challenge, but feels that the County can overcome barriers due to frozen ground conditions.
- Page 10-25 Minimize nutrient contributions from private on-site systems. The Village recognizes the value of the water resources in the area, specifically the water quality of Willow Creek and the Redgranite quarry. While the County already prohibits residential development on sites which can only support holding tanks, the Village would like to go on record in support of county zoning in regard to this issue.
- Page 10-31 Partner with the WDNR, county and other municipalities to control specific problem (invasive) species on a county-wide basis. The Village supports County and WDNR efforts to control the spread of invasive species. The Village is willing to work with the WDNR and the County on this issue.
- 4. Extraterritorial authority. The Village would like the opportunity to review land proposals and have input into land use decisions within 1.5 miles of its borders. The Village is not interested in adopting extraterritorial zoning authority. The Village would like to promote communication and planning between itself and its neighbors.

Thank you for your review and comments regarding the Village's proposed comprehensive plan. The Village and East Central also look forward to a continued working relationship with the County.

Sincerely,

Yade M. Shin-

Village of Redgranite Via Fax

Board Members:

I have had the opportunity to review the Draft Comprehensive Plan 2025 for the Village of Redgranite, and would like to extend my congratulations to those involved in the long process. It is an impressive document, and is obvious that many hours of work has went into preparing it.

As we are actively promoting our industrial Park in the Village I think it is important to supply as much information to prospective businesses as we possibly can. There is room for improvement in this document on Page 3-10. Table 3-7. Industrial Parks Group D).

I have attached to this fax a copy of the page and I have made some suggested changes, which should been relatively easy thing to do at this meeting. I would suggest that the document in its entirety be approved tonight with the changes I have suggested included in the motion.

On a related matter, I ask that the Village of Redgranite start to gather information on the process of making the Redgranite Quarry a state park. I have had some preliminary conversations with Senator Luther Olsen about the process and he is very interested in assisting us with the possibility.

Having the Quarry Park as part of the State Park System will be a wonderful "shot in the arm" for the tourism industry In our Village. The "Redgranite Quarry State Park" will become a destination point for many recreation enthusiasts, which will benefit the business climate in our Village. I would like to see this in our comprehensive plan as a goal. When the time comes for this to take place, we can look back on our plan and be in compliance with the plan at a future date.

This conversion will also limit Redgranite's exposure to liability concerning the quarry, and insure public use forever.

If this can be added to the plan. I think it will be a positive step forward for the economic development of the Village of Redgranite. I realize I am bringing this to you on the 11th hour, but am confident that the revisions can be made without attach hardship to those involved.

Thank you,

Mike Moe

Moe Land Surveying, Inc. Big enough to serve you, small enough to want to.

APPENDIX I

#### Ordinance No. 2006-05

#### AN ORDINANCE TO ADOPT THE COMPREHENSIVE PLAN OF THE VILLAGE OF REDGRANITE, WISCONSIN

The Village Board of the Village of Redgranite, Wisconsin, do ordain as follows:

SECTION 1. Pursuit to sections 62.23(2) and (3) of the Wisconsin Statutes, the Village of Redgranite is authorized to prepare and adopt a comprehensive plan as defined in sections 66.1001(1)(a) and 66.10001(2) of the Wisconsin Statutes.

SECTION 2. The Village Board of the Village of Redgranite, Wisconsin, has adopted written procedures designed to foster public participation in every stage of the preparation of a comprehensive plan as required by section 66.1001(4)(a) of the Wisconsin Statutes.

SECTION 3. The Pian Commission of the Village of Redgranite by a majority vote of the entire commission recorded in its official minutes, has adopted a resolution recommending to the Village Board the adoption of the document entitled "Village of Redgranite Draft Comprehensive Plan 2025", containing all of the elements of section 66.1001(2) of the Wisconsin Statutes.

SECTION 4. The Village has held at least one public hearing on this ordinance, in compliance with the requirements of section 66.1001(4)(d) of the Wisconsin Statutes.

SECTION 5. The Village Board of the Village of Redgranite, Wisconsin, does, by the enactment of this ordinance, formally adopt the document entitled, "Village of Redgranite Draft Comprehensive Plan 2025", pursuant to section 66.1001(4)(c) of the Wisconsin Statutes.

SECTION 6. This ordinance shall take effect upon passage by majority vote of the membership of the Viliage Board and the publication/posting as required by law.

ADOPTED this <u>20th</u> day of <u>June</u>, 2006.

Jerry July Jerry/Sieg, President

#### RESOLUTION NO. 2006-05PLAN AMENDED VILLAGE OF REDGRANITE, WISCONSIN

#### RECOMMENDING THE ADOPITON OF THE VILLAGE OF REDGRANITE DRAFT COMPREHENSIVE PLAN 2025, BY THE VILLAGE BOARD OF THE VILLAGE OF REDGRANITE.

WHEREAS, pursuant to section 62.23 (2) and (3) of the Wisconsin Statutes, the Village of Redgranite is authorized to prepare and adopt a comprehensive plan as defined in sections 66.1001(1)(a) and 66.1001(2) of the Wisconsin Statutes,

WHEREAS, the Plan Commission held a public meeting on the Draft Comprehensive Plan at its meeting on June 19, 2006.

NOW, THEREFORE, BE IT RESOLVED that the Plan Commission recommends to the Village Board of the Village of Redgranite that the "Village of Redgranite Draft Comprehensive Plan 2025", including all maps and supporting materials and all elements of the document be adopted.

BE IT FURTHER RESOLVED, one copy of the adopted draft comprehensive plan shall be sent to all of the following: every governmental body that is located in whole or in part within the boundaries of the village; the clerk of every local governmental unit that is adjacent to the village; the Wisconsin Land Council; the Wisconsin Department of Administration; and the Redoranite Public Library.

Passed and adopted on this  $\underline{19}$  day of  $\underline{50}$   $\underline{6}$ , 2006.

#### **Introduction**

"I envision Redgranite to be a 'must see' tourist attraction. It is the home of the 'State Rock' with a rich history and a visible link to the past, the Quarry. If developed, the area surrounding the quarry could provide a doorway back through time."

-George Burns (Village Priest)

and a fact of a part of the second second

These are the words of one individual but reflect the vision the people of Redgranite have for the future of their village. This Central Wisconsin village was established at the turn of the 19th century around the Granite Mining Industry. It has a very strong historic and natural identity although much of it is hidden to the eye of a regular visitor. The original objective of this project was to analyze the potential for developing a road around the quarty and provide design ideas for the park around the quarry. Although, after hosting a visioning session with community members and local village officials I discovered their other desires to develop the quarry area to cater to visitors and to promote the history of the village. Throughout the past year I worked with village officials, community members, and the East West Central Planning commission to research the valuable historic and natural resources and analyze their potential to develop them for tourism purposes. The areas of interest included the downtown area, the quarry areas, and along a regional trail. Areas for development were also looked at to provide sustainable development for the future. By applying heritage tourism principals along with preservation techniques for the natural areas I created several design solutions that attempt to capture the true essence of the village and preserve it mystifying character.

I

## Landscape/History

Redgranite is located along highway 21 in the southern portion of Waushara County. The village began in 1895 when investors from the Berlin Granite Company purchased the land from the Cronk farm because of a large granite deposit located on there. This type of granite they found was very unique as it was softer than the granite at surrounding quarries. The mining at the quarry could be worked year round and much of the

reddish-grayish stone was shipped from here to Midwest cities to build cobblestone roads. The Bannerman Railroad line was constructed to provide a direct railroad route to ship the granite directly from the new quarry to cities where the blocks were being used to construct roads.

The Village of Sand Prairie was renamed in 1904 and the Village of Redgranite was born. The village is still host to the renounced Labor Day festival that began back in 1905. Redgranite's heyday was around 1913. With a first rate school system, a high

school band that rivaled the best in the state, along with stately soccer and baseball teams. The downtown housed multiple drug, hardware, and pharmacy stores with ballrooms at each end of the town. The Village of Redgranite was considered the "heart" of Waushara County by the local newspapers. There were several factors that faded the village's Quarry Industry out of production. With unionized strikes beginning in the mid 1910's there was a perpetual struggle between the Quarry workers

and the owners. The depression also created hard times for the village. Finally, the introduction of asphalt and concrete to the road building industry eventually won over the demand for Granite Quarry Stone. The quarry industry attempted to shift markets to house building and monuments but this effort eventually failed and quarrying ended in the 1930's.

Since the quarrying days the village has introduced several industrial facilities to build back the economic base of the community. There was a pickle plant that lasted until the late 1970's and currently there are several manufacturing plants on the edge of the village that employ village residents. The population which was at nearly 2,000 in the 1910's had settled down to around 450 in the 1960's. Today, the population is around 2,000, although the village has lost some of the vitality and stature that it had at one time during its quarrying days.

Along with the strong historic presence in the village, the natural areas surrounding the village bring just as much to the essence of Redgranite as the histority. . The village is locate in the Central Sand Hills Ecological Landscape at the castern edge of what was once Glacial Lake Wisconsin. In surrounding areas there are series of glacial moraines that were later partially covered by glacial outwash. There are farmlands,

woodlots, wetland, small kettle lakes, and cold water streams in this landscape. Willow creek, a very good class 2 cold water trout stream, located across some open fields to the north of the quarry area. Historic upland vegetation consisted of oak-forest, oak savanna, and tallgrass prairie. Fens were common in this Ecological Landscape and occurred along with wet-mesic prairie, wet prairie, and rare coastal plain marshes. There are no state parks, recreation areas, state forests, or federal lands in the Ecological Landscape, though there are 24 fishery and wildlife areas. Although the lakes and rivers of the Ecological Landscape are fairly clean, it has the poorest groundwater rating of all the ecological landscapes according to Wisconsin DNR. Currently, surrounding lakes house summer cabins for visitors around the Midwest. The natural landscape is as much a part of the village as the industrial landscape that the quarry days have brought to this area.

#### Place Based Tourism

As a person travels through this village today there are still hints of the quarry era while the natural landscape provides a tranquil backdrop. Along the main street there are historic buildings lining the road and within the quarry park there are remnants of the granite crushers as well as other elements that were used to quarry the rock. The wilderness has enveloped the once barren quarry surroundings Canadian Geese and other wildlife use these natural areas for shelter. These natural and historic aspects are key assets to the village and provide the means to tell the story of the village, its surroundings, and the evolution over time.

Place based tourism is tourism based on a place, and its true character. When exploring Redgranite's true character both the historical and the natural aspects of the village should be considered. Heritage tourism and nature based tourism are realms of

the tourism industry that should be looked at in order to preserve the resources and accommodate visitors' needs in Redgranite. In order to fully comprehend what Historical Tourism is, and how it can benefit a rural community in Central Wisconsin, I read several books and journal articles examining the topic. I found the areas of covered that were most relevant to my study related to the elements of successful historical tourism, and the preservation of historical sites.

The article "Standing Out in the Crowd", by William T. Alderson, was the first article I chose to review because of its essential emphasis on creating successful heritage tourist attractions that are compelling and enjoyable to visit. The article begins by identifying Heritage Tourism as, "an organized process by which we persuade people who are not a part of our immediate community to visit and enjoy the culture, values, objects, structures, and programs which make up the heritage we preserve." This statement is a very good representation of what Heritage Tourism is. Although, it lacks the other essential elements of creating a heritage that focus on education, restoration, and preservation of the historic atmosphere and features of the site.

Another key element that is mentioned is the sharing of the cultural heritage and the ability of the heritage to produce revenue for the institution. This is very important in many Industrial Heritage locations that have old remnants of the Industrial Era that are a large part of their landscape and atmosphere. This "new use" for the monumental structures, building, and other artifacts of past era can help bring a new life to the unutilized structures through tourism. Many people allow these landmarks to become degraded and demolished; while they are the very engines that helped build the

5

1.1.1.1.1.1.1.1.1

community that they live in today. By reusing these landmarks they can help bring in revenue and restore pride in the heritage of the community.

As the article continues it begins to focus on more design related issues, such as access to the site and activities within the site. It says that sites should be, "accessible, with adequate directional signs." This can be extremely influential in the design of heritage tourism sites because it controls the visitors' ability to interpret the site. Which ultimately determines how enjoyable of an experience visitors have. Telling a story through spaces is a very difficult, but by directing the user in a logical sequential order with artifacts, location, and structures the user will embrace the history more and have a more captivating experience. Alderson says, "Beginning with the drive in to the parking lot, that tourist is comparing your institution with the many others he or she has seen." This statement touches on the importance of creating a good first impression. It is fundamental to grab the visitor's attention right away because first taste of the place is what they will begin to base their whole experience off. Alderson also states that, "Not all tourists, come to a site or museum to be taught. Most come to enjoy themselves and...to take advantage of opportunities to learn and understand something about the past... (People) are more interested in the human interactions with the artifacts.." I feel that these statements stress the importance of getting the visitor involved. It is important to get them up next to the parts of history that are still in existence today, to give them that contact with elements of the past, and to get them to feel the experience.

Along with depicting the importance of historic atmosphere the article also stresses the preservation of the historic elements that create the atmosphere. As it's stated, "If such and environment...is not adequately protected and properly managed, it

may suffer considerable damage as a result of being invaded by large number of tourists." This importance to protect the historic elements against the very industry (tourism) that makes these sites commodities is very essential. Through increased use of a site there becomes increased wear and tear on it. If not deal with through management strategies tourism becomes a negative impact on the site. Through littering, social congestion, noise pollution, and other impacts the historical qualities are degraded. The article goes on to point out that, "limits regarding historical landscapes depend upon the general layout of each physical area, its particular cultural features, special character and scale." This statement proposes that through design strategies of creating limited spaces for visitors, the impact and volume of visitors can be managed before it becomes an issue. The article does not mention though, that the activities the users participate in can also be managed with careful design. Through creating distances and spaces for the visitor with historic elements the interaction, experience, and impact can be coordinated and orchestrated to produce a fulfilling experience. i

The article ends with a statement that provides direction for future heritage tourism sites. This statement stress the importance of preserving what heritage is left and not exploiting it to the point of degradation.

"They (historic sites) are irreplaceable and therefore, should not be wasted for the sake of any short-term contemporary tourism development. They have to be preserved as carefully as possible for the sake of future generations,"

Sloss Furnaces is a National Historic Landmark that tells the story of "City Furnaces" that gave rise to the city of Birmingham, Alabama, through industrial labor. Through community and local government support the Furnaces were saved from demise and now host tours, a museum, an education center, metal arts production, and community events. The site does much for promoting the heritage of the community and reusing an Industrial Landmark, although, the site has lost some of its sense of place as far as historic atmosphere and preservation to contemporary uses.

There is a great deal of history behind the fumaces and their contribution to the city of Birmingham. The furnaces began when railroad men and land developers decided to take advantage of the areas large mineral deposits by building "blast-furnaces" that fueled the economic, employment, and social reform of the city. Through a very colorful the history the furnaces were tied to railroad manufacturing, production of war materials, and several social situations such as segregation and unionization. When the Alabama State Fair Authority was about to demolish the structures after determining the preservation of the plants was not feasible the Sloss Furnace Association lobbied and gained local and even national support for saving the structures. This support show the ability heritage has to bring communities together around a common, honorable cause.

Along with the contemporary uses of the furnaces today, there is also well documented and several historic locations within the furnaces that still promote the real history of the furnaces. These areas accommodate the more genuine experiences when visiting the site. The historic structure is well restored and through tours to the Apron of the Furnace, the Stock Trestle and the Underground Railroad Line visitors can still experience the authentic atmosphere and stories in a few locations. The Landmark's

ability to relate to visitors humanistic side through stories of workers, segregation, social clashes, and unions encapsulates those visitors truly interested in the history. True preservation of all the areas of the furnaces is rather limited and does not provide the visitor with the complete experience of the past.

"Not every museum should pursue tourism, even though they have the ability to do so." This is true because the point of some heritage areas is to promote community pride in their past. The idea of knowing where a community comes and its true character is an essential part of both heritage tourism and sense of place. Some areas do not contain a history that is very interesting to visitors but it is still important for the community to recognize the heritage on which it was built. In Redgranite the history is such a large part of the past although the natural aspect of the area should also be considered with tourism development.

Nature based tourism focuses on the natural aspect of the region and in the case of Redgranite, that is large portion of the identity of the village. The concept of nature based tourism provides for the many users of the site while bringing attention to the fragility of the natural systems in the surrounding area. Similar to historical tourism its main goal is the preservation of a commodity, nature in this case, for future generations and the benefit of surrounding ecosystems. The concept of nature based tourism is also a very good way to educated individuals about the natural systems and their importance to our everyday lives. The case of Redgranite is particularly good for this because natural systems are located right next to the downtown are in the large open fields behind the quarry. The impact of the visitors must also be managed and even though tourism isn't one of the most sustainable uses for a site it helps also bring revenue to the surrounding

community and does much better than no focus on the environment at all. Making nature based tourism a part of the tourism industry in Redgranite adds to the atmosphere and rural character the area and should be one of the main areas of focus.

# Site Inventory/Analysis

The village and surrounding areas have many historical and natural features that contribute to the identity of Redgranite. There were several opportunities and constraints in these areas that will contribute to place based tourism development.

The Bannerman Trail is a trail that that currently runs from Redgranite to Neshkoro on what used to be a railroad bed used for transporting the quarried stone. The trail is currently used for recreational purposes from hiking, to snowmobiling, to running. The line was actually constructed specifically to transport stone coming out of Redgranite although several other quarries formed along its path. Along the trail there is no hint to the historical significance of it or any of the quarries it passes. There is great potential with the Bannerman trail to link it to its heritage and tell the story behind what is now a recreational trail. The quarries along the trail are located at Redgranite, Lohrville, Spring Green, Flynn's, Glen Rock, and Neshkoro.

From historic streetscapes to quarry equipment, the region surrounding the downtown and quarry area is very significant because it was the location where the village of Redgranite was born. The buildings stretching down highway 21 just east of the County Road EE intersection have facades reminiscent of the quarry era. Some of these buildings are even registered as historical structures with Wisconsin Historical Society. There is also a large vacant lot along the highway with potential to continue the

historic streetscape. There are also other very evident links to the past within the area immediately surrounding the quarryt. There are two historic sites with the remains of the granite crushers. These ruins are a key part of the history of the quarry and should be kept intact and are an important part of the true identity of the village. These sites are very good tools to help tell the story of the history of Redgranite.

As for the quarry area itself, the underutilized buildings, large amounts of pavement, and small park area make the quarry seem somewhat secluded and hidden to passersby. There area also several vistas throughout the park that are ideal locations for both educational and recreational amenities for visitors to experience the natural beauty and historic setting. The current amenities throughout the park could also use improvement, including a trail system throughout the park that is narrow and not easily navigable, a makeshift bridge along the trail, and a lack of visitor seating areas throughout the area. The park also contains several areas of historical significance that could be used to tell the story of the quarrying days. These areas contain remnants of the footings from the crushers that were used to break the large granite boulders into smaller more manageable pieces.

Other adjacent areas to the quarry both detract from the true identity of the village and could be improved to bring back its true character. The industrial areas to the south and northwest of the quarry area do not accent the natural and historical value of the area very well. The views of these areas should be considered when looking at future developments for the park. The area to the north of the quarry which is currently abandoned farm fields should also be looked at closely. This is the area that the village was looking at for future development and possibly an area to locate a bypass road

#### through.

The individual areas throughout the quarry such as the entrance and historical sites have unique elements that can add to the historical significance of the area. The entrance area includes four structures, three of which display architecturally significant styles, and one that holds neither historical nor architectural significance. The three most southern buildings are either underutilized or vacant and other more suitable uses could be found for them. There are also several routes of traffic passing adjacent to the quarry main entrance which give the area very good advertisement, although many of the views into the quarry are obstructed by either buildings or trees. The park area at the entrance to the quarry area is also very small and can only be comfortably used by a few groups at a time. Both the historic site and the entrance area have parking areas that have no orderly pattern laid out and could be used more efficiently. The also both have steep and

rocky access to the water which makes for dangerous swimming conditions for the users of the site. The also both have very scenic vistas that display the natural beauty of the area. These sites contain much potential to be developed as areas where visitors can experience the natural and historic significance of the village.

The area just north of the quarry was where the Redgranite Economic Development Committee had indicated that they would like a bypass road placed. They felt this would provide a quicker and less congested route from County Road EE east to Highway 21. This area of land contains sandy and wet soils that are not suitable for development. The construction of a road through this area would be and expensive process and the condition of the soil would limit further development in the area. The possibility to restore the area from the abandoned farm field to the original plant communities was a more suitable option and would provide an area displaying the native land as it once was. The analysis of the soil types and current vegetation in the area indicated several suitable plant communities. They included; moist meadow, wet prairie, costal plain marsh, pine oak forest, sandy prairie, moist sandy meadow, and wet-mesic prairie.

Soil	Possible Plant
Type	Communities
Λd	Moist Meadow, Wet Prairie, Coastal Plain Marsh
PmA	Pioc Oak Forest, Sandy Prairie
Be_	Moist Sandy Meadow, Wet Prairie
Ks	Wet Mesic Prairie
MrA	Wet Mesic Prairie

Even though the area surrounding the quarry was not very suitable for development there were several other areas throughout the town that were suitable for development. Along with the concept of developing the area for tourism based off the villages resources it is

important to look at the green infrastructure of the area, such as slopes >12%, wetlands, floodplains, DNR lands, and most importantly suitable soils. This helps

identify the areas where development is possible while preserving areas of large biodiversity and natural resources. The areas that were identified as the most suitable for development were in the western portion and the northeastern areas of the village.

## Design Development Process

The process of designing throughout this project began all the way back with the first visit to Redgranite. With the first site visit, where members of the Village Economic Development Committee pointed out features of the quarry area and began brainstorming

ideas for what could be done with the park, the design process in this project was rolling. They mentioned the possible route to the north of the quarry for the road to ideas for the historical elements of the park and ideas for possible development of the field to the north of the quarry.

Later in the fall the visioning session with community members provided the concepts of where they felt improvement in the town was needed the most. After assembling all the information on the heritage of the village and discovering how important the natural areas were to the sense of place in the village the concept for place based tourism was formed.

The design process through the spring semester helped to form the most effective and creative design solutions in the areas that were chosen to express the true character of Redgranite. The constant review process from week to week with class members and faculty helped mold concepts into design solutions and modify existing designs into more effective ones. This process was very successful and pushed students to think in creative ways on other projects as well as their own. Without the design process the designs in this project would not have been as meaningful, unique as they were.

#### <u>Ethics</u>

When approaching this project it was important to consider the communities views so the final products of the project would be the most useful to them. It was also important to integrate the ethical and moral values that I have gained in the Landscape Architecture program at University of Wisconsin especially those relating to the environmental and historical significance of a place.

Last fall I gathered input from the community to find out what they felt was important in Redgranite and what aspects of the village could be improved upon. I met with the members of the Economic Development Committee several times and held a

visioning session with community members. I received several mixed responses but the general consensus was that the people of Redgranite felt the area surrounding the quarry, and the rich history of the village, were two of the most

valuable assets to the community. This desire to promote the image of the past along with which lead me to the concept of Heritage tourism. By utilizing the village's resources for Industrial Heritage Tourism, Redgranite can boost their economy while restoring, preserving, and promoting the historical character of the village and surrounding communities. By focusing on the restoring the historical elements and restoring the atmosphere of the quarrying days through interactive spaces the visitors can receive the "full" experience. The communities involvement was particularity important because it gave the project meaning to the community gave some ownership of the project.

This project also encountered several social and environmental issues related to design. The concept of place based tourism for the village was an approach that focused in on the true identity of the village and promotes the valuable features of it. There is so much history to the village and natural areas surrounding it that bring displaying it to the community was very important. This helps bring back the sense of history and the sense of place to the community because it helps give the community some pride in their

heritage and their village. It also helps preserve this heritage for future generations and provides a way to educate visitors about that heritage and gives them true image of Redgranite and its history.

The natural areas to the north of the quarty were natural habitat for various species and prime green infrastructure for the village. The concept of the bypass road through this area would have disturbed many natural processes occurring here and further development on

the land would have been costly and a great loss to the natural environment in the village. By proposing alternate areas for development this created new opportunities that village officials could look at and caused minimal impact to the environment. The idea of restoring the area to the north of the quarry its original plant communities also gives more back to the natural areas and provides the users of the park with a true sense of the natural habitats in the area.

The designs for Regranite also had to be looked at from an esthetic viewpoint. Many of the historic photos and the streetscape images gave a true concept of what the village was like in the early 1900's. This provided a conceptual image of historic times to base streetscape recommendations and park design from. By creating places with similar accents and atmospheres of the past a truer sense of the history and its identity can be achieved. From open park areas reminiscent of the barren quarry in the early 1900s to restored buildings along the streetscape the true sense of the past is achieved. As for the
aesthetic component of the natural areas, by bring the true natural feeling of the area a visitor can experience the serenity of the true natural systems of the area and enjoy the village for its true natural history along with its man-made one.

### **Design Solutions & Rationales**

#### Regional: Bonnerman Trail

After analyzing the Bannerman trail and its link to the past through the quarries alongside the trail the concept of bring that history back to life fit nicely into the the theme of place

based tourism. The most suitable solution that wouldn't interfere with the current uses of the trail and would provide information on the history of the trail and its significance was a series of amenities strategically placed at

each of the quarries along the trail as well as historic trailhead markers tying the history into the trail. The amenities would use local materials such as the stone from the quarries and would have square wooden posts representative of railroad ties, thus tying the site into its surroundings. The signs would provide information on the history of the trail and each one of the quarries that it was located next to. There would also be shelters located trail to provide trail goers protection from the elements. The use of boulders gradually getting larger as they approached a quarry and then descending in size as they lead away from the quarry would bring attention to each of the quarries as users approach them. This would subtly bring attention to the quarry and the type of stone excavated. The markers along the path would also provide a way to bring attention to the quarry while not impeding the recreational users of the trail. Theses amenities would help bring back some of the lost history of the Bannerman rail line, and would also tie into the quarry history of Redgranite as a main trailhead.

## Master Plan: Downtown Redgranite

Through the both the visioning session and separate analysis the downtown area of Redgranite was found to contain the most significant historic and natural features that bring out the true sense of Redgranite. This is where the core focus of the project is. Separate areas within the downtown were selected for more detailed focus because of the unique elements each one of them held. These areas such as, the downtown streetscape, historical sites, entrance site, and wetland restoration are explored later in the document.

Within the quarry area itself the trail system could not be accessed by elderly or handicapped persons. The design recommends improvements to the trail system to make an ADA accessible loop around the quarry so it can be experienced by all. There was also a suggestion made to create an informational display at very impressive panoramic viewpoint from a peninsula jetting out into the center of the quarry area. With such an open ranged view of the quarry area many historically significant points throughout the quarry could be pointed out on a sign that aimed the viewers in the direction of the unique elements. The industrial areas adjacent to the quarry impeded on the natural and historical atmosphere of the quarry so thick plantings of pine, oak, sumae, and dogwoods were recommended to buffers the views of these elements and contain the users presence to the park itself. There are also the recommendations to add safe water access to the quarry so recreational users of the site can enjoy swimming in water with minimal risk of injury as compared to climbing on the jagged rocks surrounding the quarry today.

The downtown streetscape is one of the main areas in the village that contains historical elements which bring out the character of Redgranite in the quarry days. The historic structures and facades can be used to recreate the ambience of that historic time

and bring the area back to its heritage. Through streetscape recommendations and guidelines the accents of the buildings can help visitors and community members alike realized the significance of the villages past. From awnings on the structures to incorporating the cobblestone pavers from the redgranite quarry stone the structures can

#### **Design Recommendations**

- Install awnings on buildings
- Install antique style signage
- Restore molding on buildings
- Uncover bricked up windows
- Remove paint & restore brick
- Redgranite pavers in sidewalks
- Provide historic style amenities
- Provide pedestrian seating

be enriched and the depth of the history can be explored. By creating more interesting facades and streetscapes along the main corridor running through the town daily travelers will begin to see the true

character behind Redgranite. The restored and enhanced streetscape will also bring more visual interest and will help to slow traffic through the area as it become a more pedestrian friendly environment with amenities such as benches and track receptacles for pedestrians to linger.

#### Site Plan: Entrance Site

As one travels along highway 21 past the quarry the barrage of pavement, trees, and buildings block the views into the quarry and a traveler can be completely unaware that they just past the quarry area. The design proposal for this area creates a grand entrance for pedestrians into the "Quarry Park". This is done by removing the buildings blocking the view into the quarry along with most of the pavement and the central portion of the trees bordering the quarry. This opens up a view into the quarry and advertises its natural beauty and historical wonder to passersby. The sun also rises just over the east side of the quarry, so the early morning commuters traveling through the village will see the sun crest over the opposite end of the quarry. By creating more green and natural space the area becomes more pedestrian friendly and welcoming to all sorts of visitors. In the center of this entrance area there is a large central lawn that provides an open area for visitors to picnic in the sun and play.

There are also several large decks that could be attached to the buildings to make the park an area where people feel welcome to linger and reminisce about the history and natural beauty of the place. The suggest path system is to be constructed to crushed granite stone to use local materials while the organic lines of the path create a softer organic feeling tying in with the natural feeling of the surrounding areas. The current

green space and picnic area could be left as is to provide a shady setting for those who prefer to relax and enjoy the area in a cooler setting. The trees also provide a nice buffer to move from the open lawn into the natural setting surrounding the quarry and from the cars in the parking area to the north of the quarry. The addition of several site amenities using local materials could also help emulate the historic and natural setting of the park. By creating two main entrance signs

framing the central lawn the quarry area would now receive the attention it deserves. The historic character of the area could also be reflected in the main signs by using the redgranite pavers on the posts of the signs and sturdy rails resembling railroad ties to hold the sign (Sheet D-A). The informational signs throughout the park could also use large sturdy wooden posts and wooden signs to create a rustic and natural feel to the visitor aids (Sheet D-B). There are seating walls bordering the paths creating boundaries for the users of the main lawn and making a barrier for the parking area and the quarry slopes. They also use the red granite pavers as facing to use local materials and advertise the importance of the quarry to the area (Sheet D-C). Through these amenities also

By providing for all different users, the site becomes a well-rounded and highly attractive visitor location for all. The two buildings with unique architecture could be renovated and their uses could be made to compliment the quarry park. The bank building could serve as a historical visitor center, displaying artifacts for the quarry days and telling stories of what the village used to be like. The old bank drive through could serve as a canopy for a main entrance from the central lawn. Just behind the bank a play

area for children could be located, with manual backhoes and other "industrial" or hands-on playground equipment giving children activities to enjoy while their parents may be there to experience more of the natural or historical setting. On the other side of the park, the old dinner could be used as a visitor center to accommodate more of the recreational users. Providing equipment rentals for swimmers and bikers on the Bannerman trail

and having recharge tanks for the scuba divers that use the site. The building would also be a prime location for a changing room for quarry swimmers. The path leading out the back the building also provides direct access to what would be the "active" of the two docks. By revitalizing these two structure into accompanying facilities the attraction for various visitors increases and the architectural uniqueness and identity of the village is protected through there restoration.

The proposed detailed planting plan for this area uses the native flora of the area and continues to advertise the natural setting of the village. There are two separate plant communities of the Central Sand Hills coological landscape represented in the planting plan, the Wet-Mesic Prairie and the Pine Barrens, and they are located according to their

microclimate in the entrance site (Sheet L-01). The Wet-Mesic

Praire plants are

located to the northern portion of the entrance site and they are mainly located in bioswales and retention basins as to take advantage of their periodically wet soils. Some plants typical of this plant community that were used include, Prairie Phlox, Prairie Blazing Star, and Shooting Star. The plants of the Pine Barrens plant community were located near the old bank building on the more southern portion of the site. The elevated

area creates dryer soils allowing the plants of the barrens to thrive. The plants typical of the Pine Barrens included, Silky Aster, Lupine,

and Western Sunflower. The plantings near the deck to the north west of the old back include Cornus Racemosa (Gray Dogwood) and Salix Humilis (Prairie Willow) to give those relaxing on the deck somewhat of a barrier form passersby. The planting throughout the site are planted to appear in natural settings with granite boulders accenting the retention basins. There is also a Wet-Mesic Prairie seed mix used in most of the retention basin areas that includes mostly grasses with a few shorter flowering species mixed in. The heights of the plants in the mixes are shorter as not to block the background plantings but still tall enough to keep a natural setting apparent. In the two bioswales framing the entrance and entrance signs are Liatris Pychnostachya (Blazing-Star), Helianthus Grosseseratus (Sawtooth Sunflower), and Dodecathon Meadia (Shooting Star). These flowers along with the light seed mixes in them present a vibrant but natural entrance to those entering or even passing the park. The rest of the plantings either bordering the decks, buildings, or bioswales are varying in heights and colors (mostly yellows and violets) as to appear natural but still very eye catching. The only two new trees are the Quercus Macrocarpa (Bur Oak) and the Pinus Banksiana (Jack Pine), these give the users of the shady picnic area some privacy while framing the quarry view from the street and balancing the north side with the elevated southern half of the site.

Ļ

ľ

Гı

Ì

The overall change in ground cover could affect the storm water runoff immensely. Some contour changes in the plan are purely aesthetic, such as to create a mounding lawn in the center and balance the site with the elevated southern portion. Other changes were intended to control runoff and direct the flow into retention basins (Sheet C-03). The basic change in ground cover by removing a large portion of the

27

paved areas and replacing it with lawn and retention basins, the overall runoff is still 12% less even when the retention basins are filled to capacity. This is attributed to the increasing amount of pervious surfaces. Even before the retention basins are filled the total amount of runoff that can be held on site is now 2610.77 cu.ft. of water. Through manipulation of contours to direct runoff, and a series of overflow piping and French drains controlling pavement runoff a much larger

alleviating much of the impact that the site currently has on the environment. This is very important especially to maintain the natural character of the area for future generations and promote attention to these natural systems to local and regional visitors alike.

## Site Plan: Historical Site

The separate historical sites within the quarry contain elements that explore both the historical and natural elements of the area combined. Since the quarry day's nature has taken over the once bare landscape surrounding the quarry to the point where the nature has become part of the character of the quarry area. It creates an encapsulating jungle in which the ruins left from the quarry area can be explored.

One area within the Quarry Park that exemplifies the natural and historical qualities of Redgranite is the historical sites of the crusher's ruins. This section of the project focused on the southeastern crusher remnants, because it is located right next to one of the current secondary parking lots for the quarry park and it is the most accessible of historical features of the site. The design proposed takes advantage of the openness of the site and allows visitors to experience the ruins at will. By not controlling the curious visitors they are allowed to read informational signs that are carefully placed and let them step back in time. The stories, pictures, and information on the sign give visitors a feel

for what the times where like. And, while wondering about they can fill in the blanks and conjure up ideas to fill in the blanks. There are plantings about one foot out from all of the ruins to prevent visitors and children from constantly touching the ruins which helps to preserve them. This also gives and effect of discovery as the ruins would feel enveloped by the surrounding nature. That feeling would also add to the sense of place in

Redgranite and the juxtaposition of the natural and historical elements that combine to form a sense of what the village is about today.

Se

Other elements of the site give the

visitor ways to experience the site while getting the true sense of the village. The path out of the historical ruins to the northwest directs the visitors gaze upon the other set of crusher remains across the quarry. The boardwalk over the crusher pit gives visitors of all ages a way to safely learn about the different parts of the crusher building. The circular scating area along with the bench facing the crusher foundations allows visitors to relax and ponder the significance of the quarry industry to the history of the village. As for the planting and storm water elements for this area, a large retention basin filled with quarried boulders is located to the north of the organized parking area for runoff from cars to be retained and filtere through nursi plantings. The plantings throughout the area are shrubs and seed mixeof the PineJak Forest that the site setting is in. These plantings and site modificanns would ready help bring out the historical and natural character of the site and alw visitors a trady experience this significant area for what it means to the village.

## Master Plan: Wetland Restoration

As one travels along the part system inter quarry park they discover how much of a name setting is a part of the park, and how much thas taken over the once barren quarry landscape. To be north of the

#### Legend

- Envronmental Education Node
- Scenic & Informational Platforms
- Boardwalks
- Natural Area Paths
- Quarry Area Paths

quarry there is the open fields that were originally considered for development with this project. Since the soils were too moist for profitable development the possibility of a addition to the quarry park appeared. This area is great natural resource for the community and has the possibility to display the benefits of the natural systems to community members and visitors. After analyzing the soil types and determining what plant communities would best suit certain areas. A trail and boardwalk system was laid out attempting to take advantage of the natural features of the site and educate users. The trail system and information nodes are located to give users the best possible idea of the benefit of natural systems to the environment. Nature is such a large part of the beauty of the village and quarry area the idea of exemplifying that beauty and what makes it possibly is very practical.

Along with providing a serenc backdrop for the quarry park and homeowners fots, the natural wetland area could serve as a bioremediation system to help remove pothutants from runoff before it enters Willow Creek. Through a series of

I

meandering streams and retention ponds the water is given a chance to pass various plants that absorb the chemicals in the water. The ponds give the particles in the water time to settle before moving on to the next set of streams. The larger pond is bigger than the other two because it has to retain more water, and it allows the water time to pool and cool down. This step is necessary because after moving passed many living plants in the streams the water heats up. Willow Creek is a trout stream and the conditions that trout can survive in arc highly dependent on the temperature of the stream. These open fields could become a great addition to a newly developed quarry park and provide so many benefits to the natural beauty of the village and natural systems around the village.

### Master Plan: Development Sites

Since the area around the quarry was better fit for natural restoration and unsuitable for development purposes, there are several other areas throughout the town suitable for development that take advantage of the natural setting of their location. These areas if developed properly can help maintain the natural beauty of the area and the rural character of Redgranite. In the development options proposed they attempt to take

advantage of both the contours and natural amenities. The lots provide scenic views and are

#### Legend

1;

ļ

unique to their location. There is open natural space flowing through both developments to give a feel of being seeluded in a non-seeluded area. The western development attempts to use the quarry as a natural feature that can be turned into a public park. Both developments blend with the existing development and buffer themselves from natural systems to maintain their stability. The size of the lots recommended should be typically larger giving residents a rural feeling but still at a size where the amount of space taken up is efficient.

# Press Release

There will be a presentation covering a Place Based Tourism Project done for the Village of Redgranite at 7:00pm on the night of Tuesday, May 17<sup>th</sup> at the Redgranite Village Hall. A student in the Landscape Architecture Department, James Fruechtl, at the University of Wisconsin at Madison has spent the last year developing designs and recommendation for the village centering on the historical and natural features of the village. The Village has such a strong sense of history and natural beauty that it is necessary to preserve these resources for future generations and promote them to draw in a larger tourism base. Mr. Fruechtl will present his project and recommendations at the beginning of the board meeting. Any and all interested guests are invited to attend.
